The ifthen package∗

David Carlisle

2022/04/13

Abstract

This file implements an \ifthenelse command for \LaTeX{} 2ε. The algorithm used is compatible with that used in the \LaTeX{} 2.09 ifthen style option. It has been recoded, making the resulting definitions somewhat more compact and efficient.

1 Introduction

\ifthenelse{⟨test⟩}{⟨then clause⟩}{⟨else clause⟩}

\ifthenelse evaluates ⟨test⟩ as a boolean function, and then executes either ⟨then clause⟩ or ⟨else clause⟩.

⟨test⟩ is a boolean expression using the infix connectives, \and, \or, the unary \not and parentheses ⟨⟩ ⟨⟩.

As an alternative notation \AND, \OR and \NOT can be used. This is safer since it can’t be misinterpreted when appearing inside a \TeX{}-conditional in which \or has a different meaning.

The atomic propositions are:
\(⟨number⟩ < ⟨number⟩\)
\(⟨number⟩ = ⟨number⟩\)
\(⟨number⟩ > ⟨number⟩\)
\isodd{⟨number⟩}
\isundefined{⟨command name⟩}
\equal{⟨string⟩}{⟨string⟩}
\lengthtest{⟨dimen⟩<⟨dimen⟩}
\lengthtest{⟨dimen⟩=⟨dimen⟩}
\lengthtest{⟨dimen⟩>⟨dimen⟩}
\boolean{⟨name⟩}

The ⟨string⟩s tested by \equal may be any sequence of commands that expand to a list of tokens. If these expansions are equal, then the proposition is true.

\isodd is true if the ⟨number⟩ is odd, and false otherwise (even if the argument is not a number).

∗This file has version number v1.1d, last revised 2022/04/13.
\isundefined{\cmd} is true if \cmd is not defined.
\boolean{xyz} returns the truth value contained in the primitive \TeX \if. \ifxyz This is usually used with boolean flags created with \newboolean and \provideboolean described below. It can also be used with the names of \newif created tokens, and primitive \TeX \if constructs, for example \boolean{true} (\iftrue), \boolean{mmode} (\ifmmode) etc.

The commands:
\newboolean{⟨name⟩} and \provideboolean{⟨name⟩} are provided so the user can easily create new boolean flags. As for \newcommand, \newboolean generates an error if the command name is not new. \provideboolean silently does nothing in that case.

The boolean flags may be set with:
\setboolean{⟨name⟩}{⟨value⟩}
⟨value⟩ may be either true or false (any CaSe).

Note that there is no precedence between \and and \or. The proposition is evaluated in a left right manner. \not only applies to the immediately following proposition. (This is consistent with Lamport’s ifthen.sty.) In this style, though the test is ‘lazily’ evaluated, so for instance if the first proposition in an \or is true, the second one is skipped. (On the second pass—the first pass in an \edef expands clauses in all propositions.)

Apart from the addition of the extra atomic propositions \isodd, \boolean, \lengthtest and \isundefined, the only known incompatibility is that in this package the expression \not\not⟨P⟩ is equivalent to ⟨P⟩. However in the original style it was equivalent to \not⟨P⟩. This is intentional (bug fix:-).

\whiledo  The command \whiledo is also defined (copied directly from the \LaTeX2.09 definition).
\whiledo{⟨test⟩}{⟨while clause⟩}
With ⟨test⟩ as above, repeatedly executes ⟨while clause⟩ while the test remains true.

2  The Implementation

\TE@throw In order to support the syntax of ifthen.sty, which allows access to the primitive \TeX syntax for a numeric test, rather than a \{\} delimited argument form, it is most convenient to work ‘within’ an \ifnum. \ift@throw ‘throws’ you out of the current \ifnum so that you can (eg) start an \ifdim for the length tests.

\boolean  A non-standard extension to ifthen, supporting boolean was previously available, this is a simpler implementation.
\boolean#1#2\%  \TE@throw{\@ne=\@ne\noexpand\if\csname if#1\endcsname#2}

\TE@length  Testing lengths. #1 is the test. The extra argument gobbles spaces.
\TE@length#1#2\{\TE@throw\noexpand\ifdim#1#2\}

\TE@odd  Testing odd/even. This is true if #1 is an odd number, and false otherwise (even \TE@odd if #1 is not a number at all).
It is hard to make this completely reliable. Here I have erred on the side of safety. This should not generate a \TeX error if given any robust commands as its argument. However it returns true on any argument that \emph{starts} with an odd number 11xx which is bad, and it can not deal with \TeX’s count registers, although LATEX counters work (via \texttt{\value}).

\begin{verbatim}
\def\TE@odd#1#2{\% \TE@throw\noexpand\TE@@odd#1\noexpand\@nil\noexpand\ifodd\count@#2} \TE@@odd is not expanded on the first pass.
\def\TE@@odd#1#2\@nil{\@defaultunits \count@\if-#1-0\else0\expandafter#1\fi#2\relax\@nnil}
\end{verbatim}

\def\TE@repl{\TE@repl} replaces the single token \#1 by \#2. (Not within \texttt{\{} groups.) It is used to replace \texttt{\texttt{\or}} by \TE@or without the need to redefine \texttt{\or}. Earlier versions just \texttt{\let\or\TE@or} but this has a bad effect on the expansion of commands which use the primitive \texttt{\or} internally, eg \texttt{\alph}, and so caused surprising results if these commands were used inside \texttt{\equal}.

\begin{verbatim}
\def\TE@repl#1#2{\long\def\@tempc##1#1##2{\def\@tempa{##2}\def\@tempb{\@tempc}\ifx\@tempa\@tempb\toks@\expandafter{\the	oks@##1}\expandafter\@gobble\else \toks@\expandafter{\the	oks@##1#2}\expandafter\@tempc\the	oks@#1\@tempc}\fi##2}\expandafter\toks@\expandafter{\expandafter}\expandafter\@tempc\the	oks@#1\@tempc}
\end{verbatim}

\def\ifthenelse{\ifthenelse} The remaining macros in this file are derived from the ones in \texttt{ifthen.sty} but recoded and simplified. The main simplification is that the original style (and the \texttt{\boolean} extensions) expressed logical values always in terms of \texttt{\ifnum}. As \texttt{\fi} is ‘untyped’ this is not necessary, so for example the length tests can return values via \texttt{\ifdim}, the trailing \texttt{\fi} will not complain, even though it was ‘expecting’ an \texttt{\ifnum}. Also the system of passing information via macros expanding to \texttt{T} or \texttt{F} has been completely replaced by a simpler system using \texttt{\iftrue}, which furthermore allows lazy evaluation on the second pass. With a LaTeX 2022/06/01 we have to ensure that \texttt{\pageref} is expandable.

\begin{verbatim}
\def\ifthenelse#1{\toks@{#1}\TE@repl\or\TE@or\TE@repl\and\TE@and\TE@repl\not\TE@neg\ifthenelse \long\def\ifthenelse#1{\long\def\ifthenelse#1{\long\def\ifthenelse#1{}}}
\end{verbatim}

\begin{verbatim}
\long\def\ifthenelse#1{\long\def\ifthenelse#1{\long\def\ifthenelse#1{}}}
\end{verbatim}

\begin{verbatim}
\long\def\ifthenelse#1{\long\def\ifthenelse#1{\long\def\ifthenelse#1{}}}
\end{verbatim}

\begin{verbatim}
\long\def\ifthenelse#1{\long\def\ifthenelse#1{\long\def\ifthenelse#1{}}}
\end{verbatim}

\begin{verbatim}
\long\def\ifthenelse#1{\long\def\ifthenelse#1{\long\def\ifthenelse#1{}}}
\end{verbatim}
Support alternate names for the boolean operators (strictly speaking only `\OR` would be necessary).

\TE@repl \OR \TE@or
\TE@repl \AND \TE@and
\TE@repl \NOT \TE@neg

The original `ifthen.sty` processed everything inside a box assignment, to catch any extra spaces before they appeared in the output. Instead I have added extra arguments to the commands so they each remove any following space.

Set up the user level names `\not` etc.

\begingroup
\let\protect\@unexpandable@protect
\TE@ref@exp
\def\value##1{\the\csname c@##1\endcsname}\
\let\equal\TE@equal\let\(\TE@lparen\let\)\TE@rparen
\let\isodd\TE@odd\let\lengthtest\TE@length
\let\isundefined\TE@undef
\endgroup

For the first pass, in a group, make various tokens non-expandable.

It is unfortunate that in order to remain compatible with `ifthen` syntax, it is necessary to have a two pass system. The first pass inside an `\edef` ‘exposes’ the `\if...\fi` tokens, so the correct clauses may be skipped on the second pass. This means that the whole `\ifthenelse` command does not work by expansion, and so possibly has only limited usefulness for macro code writers. The main problem with the `ifthen:` syntax is that (unique for \LaTeX) it does not uses a brace delimited argument form, and exposes the primitive \LaTeX syntax for `⟨number⟩`. Pretty much the only way of parsing `1 > 2 \or 2 < 1` is to actually evaluate the primitive `\ifnum`. A syntax such as:

`\or\{\numtest{1<2}\}\{\lengthtest{1pt<1in}\}`

could easily be evaluated in a one pass way, operating directly via expansion, and leaving no extra tokens in the token stream.

Still, on with the code... make `\@tempa` and `\@tempb` tokens non-expandable on the first pass.

\begingroup
\let\@tempa\relax\let\@tempb\relax
\xdef\@gtempa{\expandafter\TE@eval\the\toks@\TE@endeval}\
\endgroup

Now outside the group, execute `\@gtempa` which causes all the `\ifs` etc., to be evaluated, the final truth value is contained in the `\newif` token `\ifTE@val`. Finally this is tested and either the first or second following argument is chosen accordingly.

\begingroup
\let\@tempa\relax\let\@tempb\relax
\xdef\@gtempa{\expandafter\TE@eval\the\toks@\TE@endeval}\
\endgroup

\TE@eval Initialise a term. (Expanded on the first pass).

\def\TE@eval{\noexpand\TE@negatefalse\noexpand\iftrue\noexpand\ifnum\noexpand\ifTE@val}
Two \newifs the first holds the current truth value of the expression. The second
is a temporary flag which is true if we need to negate the current proposition.

\TE@negate Finalize a term. (Expanded on the first pass).
\TE@endeval\def\TE@endeval{\relax \noexpand\TE@setvaltrue \noexpand\else \noexpand\TE@setvalfalse \noexpand\fi \noexpand\TE@negatefalse \noexpand\fi}

\TE@setvaltrue Set the \ifTE@val to true or false depending on the value of the current proposition, and the negate flag. (Not expanded on the first pass.)
\TE@setvalfalse\def\TE@setvaltrue{\ifTE@negate\TE@valfalse\else\TE@valtrue\fi}
\def\TE@setvalfalse{\let\ifTE@val\ifTE@negate} \TE@or The internal version of \or. Ends the current term. If true skip the remaining terms.
\TE@or\def\TE@or{\TE@endeval\noexpand\ifTE@val\noexpand\else\noexpand\ifnum}
\TE@and The internal version of \and. If false skip the remaining terms.
\TE@and\def\TE@and{\TE@endeval\noexpand\ifTE@val\noexpand\ifnum}

\TE@neg \TE@negswitch \not. Throw the current context, set a negate flag, then restart the \ifnum. \TE@neg\def\TE@neg{\TE@throw\noexpand\TE@negswitch\noexpand\ifnum}
\TE@negswitch\def\TE@negswitch{\ifTE@negate\TE@negatefalse\else\TE@negatetrue\fi}
\TE@lparen \TE@rparen \). Throw the current context, then restart a term inside a group.
\TE@lparen\def\TE@lparen#1{\TE@throw\begingroup\TE@eval#1}
\TE@rparen\def\TE@rparen#1{\TE@endeval\noexpand\expandafter\endgroup\noexpand\ifTE@val#1}
\TE@equal \equal greatly simplified from the original. \def may be used rather than \edef as the whole thing is expanded anyway in the first pass. The boolean can be directly encoded with \ifx, there is no need to start an equivalent \ifnum.
\TE@equal\long\def\TE@equal#1#2#3{\TE@throw
\def\@tempa{#1}\def\@tempb{#2}\% \noexpand\expandafter\@tempa\@tempa\@tempb\@tempb\%}

\setboolean \setboolean takes \true or \false, as \#2, and sets \#1 accordingly.
\setboolean\def\setboolean#1#2{\% \lowercase\def\@tempa{#2}\%}
\newboolean Define a new ‘boolean’.
\def\newboolean#1{%\expandafter\@ifdefinable\csname if#1\endcsname{%\expandafter\newif\csname if#1\endcsname}}

\provideboolean Define a new ‘boolean’ if it is not already defined.
\def\provideboolean#1{%\@ifundefined{if#1}{%\expandafter\newif\csname if#1\endcsname}\relax}

\whiledo \whiledo copied directly from the original.\whiledo{⟨test⟩}{⟨body⟩} repeatedly evaluates ⟨body⟩ until ⟨test⟩ is true.
\long\def\whiledo#1#2{%\ifthenelse{#1}{{\@whiledotrue{\@whilesw\if@whiledo\fi{#2}}}{\ifthenelse{#1}{{\@whiledotrue{\@whiledofalse}}}{{} }}}}

\TE@undef test if csname is defined. \ifx test.
\def\TE@undef#1#2{%\TE@throw\noexpand\ifx\noexpand\@undefined\noexpand#1#2}

\if@whiledo Internal switch for \whiledo.\newif\if@whiledo\if@whiledo

{/package)
