

# The package `piton`\*

F. Pantigny  
fpantigny@wanadoo.fr

March 30, 2024

## Abstract

The package `piton` provides tools to typeset computer listings in Python, OCaml, C and SQL with syntactic highlighting by using the Lua library LPEG. It requires LuaLaTeX.

## 1 Presentation

The package `piton` uses the Lua library LPEG<sup>1</sup> for parsing Python, OCaml, C or SQL listings and typesets them with syntactic highlighting. Since it uses the Lua of LuaLaTeX, it works with `lualatex` only (and won't work with the other engines: `latex`, `pdflatex` and `xelatex`). It does not use external program and the compilation does not require `--shell-escape`. The compilation is very fast since all the parsing is done by the library LPEG, written in C.

Here is an example of code typeset by `piton`, with the environment `{Piton}`.

```
from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
        (we have used that arctan(x) + arctan(1/x) =  $\frac{\pi}{2}$  for  $x > 0$ )2
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
```

## 2 Installation

The package `piton` is contained in two files: `piton.sty` and `piton.lua` (the LaTeX file `piton.sty` loaded by `\usepackage` will load the Lua file `piton.lua`). Both files must be in a repertory where LaTeX will be able to find them, for instance in a `texmf` tree. However, the best is to install `piton` with a TeX distribution such as MiKTeX, TeX Live or MacTeX.

---

\*This document corresponds to the version 2.7a of `piton`, at the date of 2024/03/30.

<sup>1</sup>LPEG is a pattern-matching library for Lua, written in C, based on *parsing expression grammars*: <http://www.inf.puc-rio.br/~roberto/lpeg/>

<sup>2</sup>This LaTeX escape has been done by beginning the comment by `#>`.

### 3 Use of the package

The package `piton` must be used with LuaLaTeX exclusively: if another LaTeX engine (`latex`, `pdflatex`, `xelatex`,...) is used, a fatal error will be raised.

#### 3.1 Loading the package

The package `piton` should be loaded by: `\usepackage{piton}`.

If, at the end of the preamble, the package `xcolor` has not been loaded (by the final user or by another package), `piton` loads `xcolor` with the instruction `\usepackage{xcolor}` (that is to say without any option). The package `piton` doesn't load any other package.

#### 3.2 Choice of the computer language

In current version, the package `piton` supports four computer languages: Python, OCaml, SQL and C (in fact C++). It supports also a special language called “minimal”: cf. p. 27.

By default, the language used is Python.

It's possible to change the current language with the command `\PitonOptions` and its key `language`: `\PitonOptions{language = C}`.

For the developpers, let's say that the name of the current language is stored (in lower case) in the L3 public variable `\l_piton_language_str`.

In what follows, we will speak of Python, but the features described also apply to the other languages.

#### 3.3 The tools provided to the user

The package `piton` provides several tools to typeset Python code: the command `\piton`, the environment `{Piton}` and the command `\PitonInputFile`.

- The command `\piton` should be used to typeset small pieces of code inside a paragraph. For example:

```
\piton{def square(x): return x*x}    def square(x): return x*x
```

The syntax and particularities of the command `\piton` are detailed below.

- The environment `{Piton}` should be used to typeset multi-lines code. Since it takes its argument in a verbatim mode, it can't be used within the argument of a LaTeX command. For sake of customization, it's possible to define new environments similar to the environment `{Piton}` with the command `\NewPitonEnvironment`: cf. 4.3 p. 8.
- The command `\PitonInputFile` is used to insert and typeset a external file.

It's possible to insert only a part of the file: cf. part 5.2, p. 10.

The key `path` of the command `\PitonOptions` specifies a path where the files included by `\PitonInputFile` will be searched.

#### 3.4 The syntax of the command `\piton`

In fact, the command `\piton` is provided with a double syntax. It may be used as a standard command of LaTeX taking its argument between curly braces (`\piton{...}`) but it may also be used with a syntax similar to the syntax of the command `\verb`, that is to say with the argument delimited by two identical characters (e.g.: `\piton|...|`).

- **Syntax `\piton{...}`**

When its argument is given between curly braces, the command `\piton` does not take its argument in verbatim mode. In particular:

- several consecutive spaces will be replaced by only one space (and the also the character of end on line),  
but the command `\_` is provided to force the insertion of a space;

- it's not possible to use % inside the argument,  
but the command `\%` is provided to insert a %;
- the braces must be appear by pairs correctly nested  
but the commands `\{` and `\}` are also provided for individual braces;
- the LaTeX commands<sup>3</sup> are fully expanded and not executed,  
so it's possible to use `\\` to insert a backslash.

The other characters (including #, ^, \_, &, \$ and @) must be inserted without backslash.

Examples :

<code>\piton{MyString = '\n'}</code>	<code>MyString = '\n'</code>
<code>\piton{def even(n): return n%2==0}</code>	<code>def even(n): return n%2==0</code>
<code>\piton{c="#" # an affectation }</code>	<code>c="#" # an affectation</code>
<code>\piton{c="#" \ \ \ # an affectation }</code>	<code>c="#" # an affectation</code>
<code>\piton{MyDict = {'a': 3, 'b': 4 }}</code>	<code>MyDict = {'a': 3, 'b': 4 }</code>

It's possible to use the command `\piton` in the arguments of a LaTeX command.<sup>4</sup>

- **Syntaxe `\piton|...|`**

When the argument of the command `\piton` is provided between two identical characters, that argument is taken in a *verbatim mode*. Therefore, with that syntax, the command `\piton` can't be used within the argument of another command.

Examples :

<code>\piton MyString = '\n' </code>	<code>MyString = '\n'</code>
<code>\piton!def even(n): return n%2==0!</code>	<code>def even(n): return n%2==0</code>
<code>\piton+c="#" # an affectation +</code>	<code>c="#" # an affectation</code>
<code>\piton?MyDict = {'a': 3, 'b': 4}?</code>	<code>MyDict = {'a': 3, 'b': 4}</code>

## 4 Customization

With regard to the font used by `piton` in its listings, it's only the current monospaced font. The package `piton` merely uses internally the standard LaTeX command `\texttt`.

### 4.1 The keys of the command `\PitonOptions`

The command `\PitonOptions` takes in as argument a comma-separated list of *key=value* pairs. The scope of the settings done by that command is the current TeX group.<sup>5</sup> These keys may also be applied to an individual environment `{Piton}` (between square brackets).

- The key `language` specifies which computer language is considered (that key is case-insensitive). Five values are allowed : `Python`, `OCaml`, `C`, `SQL` and `minimal`. The initial value is `Python`.
- The key `path` specifies a path where the files included by `\PitonInputFile` will be searched.
- The key `gobble` takes in as value a positive integer *n*: the first *n* characters are discarded (before the process of highlighting of the code) for each line of the environment `{Piton}`. These characters are not necessarily spaces.
- When the key `auto-gobble` is in force, the extension `piton` computes the minimal value *n* of the number of consecutive spaces beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of *n*.

<sup>3</sup>That concerns the commands beginning with a backslash but also the active characters (with catcode equal to 13).

<sup>4</sup>For example, it's possible to use the command `\piton` in a footnote. Example : `s = 'A string'`.

<sup>5</sup>We remind that a LaTeX environment is, in particular, a TeX group.

- When the key `env-gobble` is in force, `piton` analyzes the last line of the environment `{Piton}`, that is to say the line which contains `\end{Piton}` and determines whether that line contains only spaces followed by the `\end{Piton}`. If we are in that situation, `piton` computes the number  $n$  of spaces on that line and applies `gobble` with that value of  $n$ . The name of that key comes from *environment gobble*: the effect of `gobble` is set by the position of the commands `\begin{Piton}` and `\end{Piton}` which delimit the current environment.
- The key `write` takes in as argument a name of file (with its extension) and write the content<sup>6</sup> of the current environment in that file. At the first use of a file by `piton`, it is erased.
- The key `path-write` specifies a path where the files written by the key `write` will be written.
- The key `line-numbers` activates the line numbering in the environments `{Piton}` and in the listings resulting from the use of `\PitonInputFile`.

In fact, the key `line-numbers` has several subkeys.

- With the key `line-numbers/skip-empty-lines`, the empty lines (which contains only spaces) are considered as non existent for the line numbering (if the key `/absolute`, described below, is in force, the key `/skip-empty-lines` is no-op in `\PitonInputFile`). The initial value of that key is `true` (and not `false`).<sup>7</sup>
- With the key `line-numbers/label-empty-lines`, the labels (that is to say the numbers) of the empty lines are displayed. If the key `/skip-empty-line` is in force, the clé `/label-empty-lines` is no-op. The initial value of that key is `true`.<sup>8</sup>
- With the key `line-numbers/absolute`, in the listings generated in `\PitonInputFile`, the numbers of the lines displayed are *absolute* (that is to say: they are the numbers of the lines in the file). That key may be useful when `\PitonInputFile` is used to insert only a part of the file (cf. part 5.2, p. 10). The key `/absolute` is no-op in the environments `{Piton}` and those created by `\NewPitonEnvironment`.
- The key `line-numbers/start` requires that the line numbering begins to the value of the key.
- With the key `line-numbers/resume`, the counter of lines is not set to zero at the beginning of each environment `{Piton}` or use of `\PitonInputFile` as it is otherwise. That allows a numbering of the lines across several environments.
- The key `line-numbers/sep` is the horizontal distance between the numbers of lines (inserted by `line-numbers`) and the beginning of the lines of code. The initial value is 0.7 em.

For convenience, a mechanism of factorisation of the prefix `line-numbers` is provided. That means that it is possible, for instance, to write:

```
\PitonOptions
{
  line-numbers =
  {
    skip-empty-lines = false ,
    label-empty-lines = false ,
    sep = 1 em
  }
}
```

- The key `left-margin` corresponds to a margin on the left. That key may be useful in conjunction with the key `line-numbers` if one does not want the numbers in an overlapping position on the left.

---

<sup>6</sup>In fact, it's not exactly the body of the environment but the value of `piton.get_last_code()` which is the body without the overwritten LaTeX formatting instructions (cf. the part 6, p. 18).

<sup>7</sup>For the language Python, the empty lines in the docstrings are taken into account (by design).

<sup>8</sup>When the key `split-on-empty-lines` is in force, the labels of the empty are never printed.

It's possible to use the key `left-margin` with the value `auto`. With that value, if the key `line-numbers` is in force, a margin will be automatically inserted to fit the numbers of lines. See an example part 7.1 on page 19.

- The key `background-color` sets the background color of the environments `{Piton}` and the listings produced by `\PitonInputFile` (it's possible to fix the width of that background with the key `width` described below).

The key `background-color` supports also as value a *list* of colors. In this case, the successive rows are colored by using the colors of the list in a cyclic way.

*Example* : `\PitonOptions{background-color = {gray!5,white}}`

The key `background-color` accepts a color defined «on the fly». For example, it's possible to write `background-color = [cmyk]{0.1,0.05,0,0}`.

- With the key `prompt-background-color`, `piton` adds a color background to the lines beginning with the prompt "`>>>`" (and its continuation "`...`") characteristic of the Python consoles with REPL (*read-eval-print loop*).
- The key `width` will fix the width of the listing. That width applies to the colored backgrounds specified by `background-color` and `prompt-background-color` but also for the automatic breaking of the lines (when required by `break-lines`: cf. 5.1.2, p. 9).

That key may take in as value a numeric value but also the special value `min`. With that value, the width will be computed from the maximal width of the lines of code. Caution: the special value `min` requires two compilations with LuaLaTeX<sup>9</sup>.

For an example of use of `width=min`, see the section 7.2, p. 19.

- When the key `show-spaces-in-strings` is activated, the spaces in the strings of characters<sup>10</sup> are replaced by the character `□` (U+2423 : OPEN BOX). Of course, that character U+2423 must be present in the monospaced font which is used.<sup>11</sup>

*Example* : `my_string = 'Very□good□answer'`

With the key `show-spaces`, all the spaces are replaced by U+2423 (and no line break can occur on those "visible spaces", even when the key `break-lines`<sup>12</sup> is in force). By the way, one should remark that all the trailing spaces (at the end of a line) are deleted by `piton`. The tabulations at the beginning of the lines are represented by arrows.

```
\begin{Piton}[language=C,line-numbers,auto-gobble,background-color = gray!15]
void bubbleSort(int arr[], int n) {
    int temp;
    int swapped;
    for (int i = 0; i < n-1; i++) {
        swapped = 0;
        for (int j = 0; j < n - i - 1; j++) {
            if (arr[j] > arr[j + 1]) {
                temp = arr[j];
                arr[j] = arr[j + 1];
                arr[j + 1] = temp;
                swapped = 1;
            }
        }
        if (!swapped) break;
    }
}
```

<sup>9</sup>The maximal width is computed during the first compilation, written on the `aux` file and re-used during the second compilation. Several tools such as `latexmk` (used by Overleaf) do automatically a sufficient number of compilations.

<sup>10</sup>With the language Python that feature applies only to the short strings (delimited by `'` or `"`). In OCaml, that feature does not apply to the *quoted strings*.

<sup>11</sup>The package `piton` simply uses the current monospaced font. The best way to change that font is to use the command `\setmonofont` of the package `fontspec`.

<sup>12</sup>cf. 5.1.2 p. 9

```

    }
  }
\end{Piton}

1 void bubbleSort(int arr[], int n) {
2     int temp;
3     int swapped;
4     for (int i = 0; i < n-1; i++) {
5         swapped = 0;
6         for (int j = 0; j < n - i - 1; j++) {
7             if (arr[j] > arr[j + 1]) {
8                 temp = arr[j];
9                 arr[j] = arr[j + 1];
10                arr[j + 1] = temp;
11                swapped = 1;
12            }
13        }
14        if (!swapped) break;
15    }
16 }

```

The command `\PitonOptions` provides in fact several other keys which will be described further (see in particular the “Pages breaks and line breaks” p. 8).

## 4.2 The styles

### 4.2.1 Notion of style

The package `piton` provides the command `\SetPitonStyle` to customize the different styles used to format the syntactic elements of the Python listings. The customizations done by that command are limited to the current TeX group.<sup>13</sup>

The command `\SetPitonStyle` takes in as argument a comma-separated list of *key=value* pairs. The keys are names of styles and the value are LaTeX formatting instructions.

These LaTeX instructions must be formatting instructions such as `\color{...}`, `\bfseries`, `\slshape`, etc. (the commands of this kind are sometimes called *semi-global* commands). It’s also possible to put, *at the end of the list of instructions*, a LaTeX command taking exactly one argument.

Here an example which changes the style used to highlight, in the definition of a Python function, the name of the function which is defined. That code uses the command `\highLight` of `lua-ul` (that package requires also the package `luacolor`).

```
\SetPitonStyle{ Name.Function = \bfseries \highLight[red!50] }
```

In that example, `\highLight[red!50]` must be considered as the name of a LaTeX command which takes in exactly one argument, since, usually, it is used with `\highLight[red!50]{...}`.

With that setting, we will have : `def cube(x) : return x * x * x`

The different styles, and their use by `piton` in the different languages which it supports (Python, OCaml, C, SQL and “minimal”), are described in the part 8, starting at the page 23.

The command `\PitonStyle` takes in as argument the name of a style and allows to retrieve the value (as a list of LaTeX instructions) of that style.

For example, it’s possible to write `{\PitonStyle{Keyword}{function}}` and we will have the word `function` formatted as a keyword.

<sup>13</sup>We remind that a LaTeX environment is, in particular, a TeX group.

The syntax `{\PitonStyle{style}{...}}` is mandatory in order to be able to deal both with the semi-global commands and the commands with arguments which may be present in the definition of the style *style*.

#### 4.2.2 Global styles and local styles

A style may be defined globally with the command `\SetPitonStyle`. That means that it will apply to all the informatic languages that use that style.

For example, with the command

```
\SetPitonStyle{Comment = \color{gray}}
```

all the comments will be composed in gray in all the listings, whatever informatic language they use (Python, C, OCaml, etc.).

But it's also possible to define a style locally for a given informatic language by providing the name of that language as optional argument (between square brackets) to the command `\SetPitonStyle`.<sup>14</sup>

For example, with the command

```
\SetPitonStyle[SQL]{Keywords = \color[HTML]{006699} \bfseries \MakeUppercase}
```

the keywords in the SQL listings will be composed in capital letters, even if they appear in lower case in the LaTeX source (we recall that, in SQL, the keywords are case-insensitive).

As expected, if an informatic language uses a given style and if that style has no local definition for that language, the global version is used. That notion of “global style” has no link with the notion of global definition in TeX (the notion of *group* in TeX).<sup>15</sup>

The package `piton` itself (that is to say the file `piton.sty`) defines all the styles globally.

#### 4.2.3 The style `UserFunction`

The extension `piton` provides a special style called `UserFunction`. That style applies to the names of the functions previously defined by the user (for example, in Python, these names are those following the keyword `def` in a previous Python listing). The initial value of that style is empty, and, therefore, the names of the functions are formatted as standard text (in black). However, it's possible to change the value of that style, as any other style, with the command `\SetPitonStyle`.

In the following example, we tune the styles `Name.Function` and `UserFunction` so as to have clickable names of functions linked to the (informatic) definition of the function.

```
\NewDocumentCommand{\MyDefFunction}{m}
  {\hypertarget{piton:#1}{\color[HTML]{CC00FF}{#1}}}
\NewDocumentCommand{\MyUserFunction}{m}{\hyperlink{piton:#1}{#1}}

\SetPitonStyle{Name.Function = \MyDefFunction, UserFunction = \MyUserFunction}
```

```
def transpose(v,i,j):
    x = v[i]
    v[i] = v[j]
    v[j] = x
```

---

<sup>14</sup>We recall, that, in the package `piton`, the names of the informatic languages are case-insensitive.

<sup>15</sup>As regards the TeX groups, the definitions done by `\SetPitonStyle` are always local.

```
def passe(v):
    for i in range(0, len(v)-1):
        if v[i] > v[i+1]:
            transpose(v, i, i+1)
```

Of course, the list of the names of Python functions previously defined is kept in the memory of LuaLaTeX (in a global way, that is to say independently of the TeX groups). The extension `piton` provides a command to clear that list : it's the command `\PitonClearUserFunctions`. When it is used without argument, that command is applied to all the informatic languages used by the user but it's also possible to use it with an optional argument (between square brackets) which is a list of informatic languages to which the command will be applied.<sup>16</sup>

### 4.3 Creation of new environments

Since the environment `{Piton}` has to catch its body in a special way (more or less as verbatim text), it's not possible to construct new environments directly over the environment `{Piton}` with the classical commands `\newenvironment` (of standard LaTeX) or `\NewDocumentEnvironment` (of LaTeX3).

That's why `piton` provides a command `\NewPitonEnvironment`. That command takes in three mandatory arguments.

That command has the same syntax as the classical environment `\NewDocumentEnvironment`.<sup>17</sup>

With the following instruction, a new environment `{Python}` will be constructed with the same behaviour as `{Piton}`:

```
\NewPitonEnvironment{Python}{0}{\PitonOptions{#1}}{}
```

If one wishes to format Python code in a box of `tcolorbox`, it's possible to define an environment `{Python}` with the following code (of course, the package `tcolorbox` must be loaded).

```
\NewPitonEnvironment{Python}{}
{\begin{tcolorbox}}
{\end{tcolorbox}}
```

With this new environment `{Python}`, it's possible to write:

```
\begin{Python}
def square(x):
    """Compute the square of a number"""
    return x*x
\end{Python}
```

```
def square(x):
    """Compute the square of a number"""
    return x*x
```

## 5 Advanced features

### 5.1 Page breaks and line breaks

#### 5.1.1 Page breaks

By default, the listings produced by the environment `{Piton}` and the command `\PitonInputFile` are not breakable.

However, the command `\PitonOptions` provides the keys `split-on-empty-lines` and `splittable` to allow such breaks.

<sup>16</sup>We remind that, in `piton`, the name of the informatic languages are case-insensitive.

<sup>17</sup>However, the specifier of argument `b` (used to catch the body of the environment as a LaTeX argument) is not allowed.

- **New 2.7**

The key `split-on-empty-lines` allows breaks on the empty lines<sup>18</sup> in the listing. In the informatic listings, the empty lines usually separate the definitions of the informatic functions and it's pertinent to allow breaks between these functions.

In fact, when the key `split-on-empty-lines` is in force, the work goes a little further than merely allowing page breaks: several successive empty lines are deleted and replaced by the content of the parameter corresponding to the key `split-separation`. The initial value of this parameter is `\vspace{\baselineskip}\vspace{-1.25pt}` which corresponds eventually to an empty line in the final PDF (this vertical space is deleted if it occurs on a page break).

- Of course, the key `split-on-empty-lines` may not be sufficient and that's why `piton` provides the key `splittable`.

When the key `splittable` is used with the numeric value  $n$  (which must be a positive integer) the listing, or each part of the listing delimited by empty lines (when `split-on-empty-lines` is in force) may be broken anywhere with the restriction that no break will occur within the  $n$  first lines of the listing or within the  $n$  last lines. For example, a tuning with `splittable = 4` may be a good choice.

When used without value, the key `splittable` is equivalent to `splittable = 1` and the listings may be broken anywhere (it's probably not recommandable).

Even with a background color (set by the key `background-color`), the pages breaks are allowed, as soon as the key `split-on-empty-lines` or the key `splittable` is in force.<sup>19</sup>

### 5.1.2 Line breaks

By default, the elements produced by `piton` can't be broken by an end on line. However, there are keys to allow such breaks (the possible breaking points are the spaces, even the spaces in the Python strings).

- With the key `break-lines-in-piton`, the line breaks are allowed in the command `\piton{...}` (but not in the command `\piton|...|`, that is to say the command `\piton` in verbatim mode).
- With the key `break-lines-in-Piton`, the line breaks are allowed in the environment `{Piton}` (hence the capital letter P in the name) and in the listings produced by `\PitonInputFile`.
- The key `break-lines` is a conjunction of the two previous keys.

The package `piton` provides also several keys to control the appearance on the line breaks allowed by `break-lines-in-Piton`.

- With the key `indent-broken-lines`, the indentation of a broken line is respected at carriage return.
- The key `end-of-broken-line` corresponds to the symbol placed at the end of a broken line. The initial value is: `\hspace*{0.5em}\textbackslash`.
- The key `continuation-symbol` corresponds to the symbol placed at each carriage return. The initial value is: `+\;` (the command `\;` inserts a small horizontal space).
- The key `continuation-symbol-on-indentation` corresponds to the symbol placed at each carriage return, on the position of the indentation (only when the key `indent-broken-line` is in force). The initial value is:  `$\hookrightarrow\;$`.

The following code has been composed with the following tuning:

---

<sup>18</sup>The "empty lines" are the lines which contains only spaes.

<sup>19</sup>With the key `splittable`, the environments `{Piton}` are breakable, even within a (breakable) environment of `tcolorbox`. Remind that an environment of `tcolorbox` included in another environment of `tcolorbox` is *not* breakable, even when both environments use the key `breakable` of `tcolorbox`.

```
\PitonOptions{width=12cm,break-lines,indent-broken-lines,background-color=gray!15}
```

```
def dict_of_list(l):  
    """Converts a list of subrs and descriptions of glyphs in \  
    ↪ a dictionary"""  
    our_dict = {}  
    for list_letter in l:  
        if (list_letter[0][0:3] == 'dup'): # if it's a subr  
            name = list_letter[0][4:-3]  
            print("We treat the subr of number " + name)  
        else:  
            name = list_letter[0][1:-3] # if it's a glyph  
            print("We treat the glyph of number " + name)  
        our_dict[name] = [treat_Postscript_line(k) for k in \  
        ↪ list_letter[1:-1]]  
    return dict
```

## 5.2 Insertion of a part of a file

The command `\PitonInputFile` inserts (with formatting) the content of a file. In fact, it's possible to insert only *a part* of that file. Two mechanisms are provided in this aim.

- It's possible to specify the part that we want to insert by the numbers of the lines (in the original file).
- It's also possible to specify the part to insert with textual markers.

In both cases, if we want to number the lines with the numbers of the lines in the file, we have to use the key `line-numbers/absolute`.

### 5.2.1 With line numbers

The command `\PitonInputFile` supports the keys `first-line` and `last-line` in order to insert only the part of file between the corresponding lines. Not to be confused with the key `line-numbers/start` which fixes the first line number for the line numbering. In a sens, `line-numbers/start` deals with the output whereas `first-line` and `last-line` deal with the input.

### 5.2.2 With textual markers

In order to use that feature, we first have to specify the format of the markers (for the beginning and the end of the part to include) with the keys `marker-beginning` and `marker-end` (usually with the command `\PitonOptions`).

Let us take a practical example.

We assume that the file to include contains solutions to exercises of programming on the following model.

```
#[Exercise 1] Iterative version  
def fibo(n):  
    if n==0: return 0  
    else:  
        u=0  
        v=1  
        for i in range(n-1):  
            w = u+v  
            u = v  
            v = w  
        return v  
#<Exercise 1>
```

The markers of the beginning and the end are the strings `#[Exercise 1]` and `#<Exercise 1>`. The string “`Exercise 1`” will be called the *label* of the exercise (or of the part of the file to be included). In order to specify such markers in `piton`, we will use the keys `marker/beginning` and `marker/end` with the following instruction (the character `#` of the comments of Python must be inserted with the protected form `\#`).

```
\PitonOptions{ marker/beginning = \#[#1] , marker/end = \#<#1> }
```

As one can see, `marker/beginning` is an expression corresponding to the mathematical function which transforms the label (here `Exercise 1`) into the the beginning marker (in the example `#[Exercise 1]`). The string `#1` corresponds to the occurrences of the argument of that function, which the classical syntax in TeX. Idem for `marker/end`.

Now, you only have to use the key `range` of `\PitonInputFile` to insert a marked content of the file.

```
\PitonInputFile[range = Exercise 1]{file_name}
```

```
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
```

The key `marker/include-line` requires the insertion of the lines containing the markers.

```
\PitonInputFile[marker/include-lines,range = Exercise 1]{file_name}
```

```
#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
#<Exercise 1>
```

In fact, there exist also the keys `begin-range` and `end-range` to insert several marked contents at the same time.

For example, in order to insert the solutions of the exercises 3 to 5, we will write (if the file has the correct structure!):

```
\PitonInputFile[begin-range = Exercise 3, end-range = Exercise 5]{file_name}
```

## 5.3 Highlighting some identifiers

### Modification 2.4

The command `\SetPitonIdentifier` allows to change the formatting of some identifiers.

That command takes in three arguments:

- The optionnal argument (within square brackets) specifies the informatic langage. If this argument is not present, the tunings done by `\SetPitonIdentifier` will apply to all the informatic langages of `piton`.<sup>20</sup>
- The first mandatory argument is a comma-separated list of names of identifiers.
- The second mandatory argument is a list of LaTeX instructions of the same type as `piton` “styles” previously presented (cf 4.2 p. 6).

*Caution:* Only the identifiers may be concerned by that key. The keywords and the built-in functions won't be affected, even if their name appear in the first argument of the command `\SetPitonIdentifier`.

```
\SetPitonIdentifier{l1,l2}{\color{red}}
\begin{Piton}
def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)
\end{Piton}
```

```
def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)
```

By using the command `\SetPitonIdentifier`, it's possible to add other built-in functions (or other new keywords, etc.) that will be detected by `piton`.

```
\SetPitonIdentifier[Python]
{cos, sin, tan, floor, ceil, trunc, pow, exp, ln, factorial}
{\PitonStyle{Name.Builtin}}

\begin{Piton}
from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)
\end{Piton}
```

---

<sup>20</sup>We recall, that, in the package `piton`, the names of the informatic languages are case-insensitive.

```

from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)

```

## 5.4 Mechanisms to escape to LaTeX

The package `piton` provides several mechanisms for escaping to LaTeX:

- It's possible to compose comments entirely in LaTeX.
- It's possible to have the elements between `$` in the comments composed in LaTeX mathematical mode.
- It's possible to ask `piton` to detect automatically some LaTeX commands, thanks to the key `detected-commands`.
- It's also possible to insert LaTeX code almost everywhere in a Python listing.

One should also remark that, when the extension `piton` is used with the class `beamer`, `piton` detects in `{Piton}` many commands and environments of Beamer: cf. 5.5 p. 16.

### 5.4.1 The “LaTeX comments”

In this document, we call “LaTeX comments” the comments which begins by `#>`. The code following those characters, until the end of the line, will be composed as standard LaTeX code. There is two tools to customize those comments.

- It's possible to change the syntatic mark (which, by default, is `#>`). For this purpose, there is a key `comment-latex` available only in the preamble of the document, allows to choice the characters which, preceded by `#`, will be the syntatic marker.

For example, if the preamble contains the following instruction:

```
\PitonOptions{comment-latex = LaTeX}
```

the LaTeX comments will begin by `#LaTeX`.

If the key `comment-latex` is used with the empty value, all the Python comments (which begins by `#`) will, in fact, be “LaTeX comments”.

- It's possible to change the formatting of the LaTeX comment itself by changing the `piton style Comment.LaTeX`.

For example, with `\SetPitonStyle{Comment.LaTeX = \normalfont\color{blue}}`, the LaTeX comments will be composed in blue.

If you want to have a character `#` at the beginning of the LaTeX comment in the PDF, you can use `set Comment.LaTeX` as follows:

```
\SetPitonStyle{Comment.LaTeX = \color{gray}\#\normalfont\space }
```

For other examples of customization of the LaTeX comments, see the part 7.2 p. 19

If the user has required line numbers (with the key `line-numbers`), it's possible to refer to a number of line with the command `\label` used in a LaTeX comment.<sup>21</sup>

---

<sup>21</sup>That feature is implemented by using a redefinition of the standard command `\label` in the environments `{Piton}`. Therefore, incompatibilities may occur with extensions which redefine (globally) that command `\label` (for example: `varioref`, `refcheck`, `showlabels`, etc.)

### 5.4.2 The key “math-comments”

It’s possible to request that, in the standard Python comments (that is to say those beginning by # and not #>), the elements between \$ be composed in LaTeX mathematical mode (the other elements of the comment being composed verbatim).

That feature is activated by the key `math-comments`, which is available only in the preamble of the document.

Here is a example, where we have assumed that the preamble of the document contains the instruction `\PitonOptions{math-comment}`:

```
\begin{Piton}
def square(x):
    return x*x # compute  $x^2$ 
\end{Piton}
```

```
def square(x):
    return x*x # compute  $x^2$ 
```

### 5.4.3 The key “detected-commands”

The key `detected-commands` of `\PitonOptions` allow to specify a (comma-separated) list of names of LaTeX commands that will be detected directly by `piton`.

- The key `detected-commands` must be used in the preamble of the LaTeX document.
- The names of the LaTeX commands must appear without the leading backslash (eg. `detected-commands = { emph, textbf }`).
- These commands must be LaTeX commands with only one (mandatory) argument between braces (and these braces must be explicit).

We assume that the preamble of the LaTeX document contains the following line.

```
\PitonOptions{detected-commands = highlight}
```

Then, it’s possible to write directly:

```
\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        \highlight{return n*fact(n-1)}
\end{Piton}
```

```
def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)
```

### 5.4.4 The mechanism “escape”

It’s also possible to overwrite the Python listings to insert LaTeX code almost everywhere (but between lexical units, of course). By default, `piton` does not fix any delimiters for that kind of escape. In order to use this mechanism, it’s necessary to specify the delimiters which will delimit the escape (one for the beginning and one for the end) by using the keys `begin-escape` and `end-escape`, available only in the preamble of the document.

We consider once again the previous example of a recursive programming of the factorial. We want to highlight in pink the instruction containing the recursive call. With the package `lua-ul`, we can use the syntax `\highlight[LightPink]{...}`. Because of the optional argument between square

brackets, it's not possible to use the key `detected-commands` but it's possible to achieve our goal with the more general mechanism “escape”.

We assume that the preamble of the document contains the following instruction:

```
\PitonOptions{begin-escape=!,end-escape=!}
```

Then, it's possible to write:

```
\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        !\highlight[LightPink]{!return n*fact(n-1)!}
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)
```

*Caution* : The escape to LaTeX allowed by the `begin-escape` and `end-escape` is not active in the strings nor in the Python comments (however, it's possible to have a whole Python comment composed in LaTeX by beginning it with `#>`; such comments are merely called “LaTeX comments” in this document).

#### 5.4.5 The mechanism “escape-math”

The mechanism “`escape-math`” is very similar to the mechanism “`escape`” since the only difference is that the elements sent to LaTeX are composed in the math mode of LaTeX.

This mechanism is activated with the keys `begin-escape-math` and `end-escape-math` (*which are available only in the preamble of the document*).

Despite the technical similarity, the use of the the mechanism “`escape-math`” is in fact rather different from that of the mechanism “`escape`”. Indeed, since the elements are composed in a mathematical mode of LaTeX, they are, in particular, composed within a TeX group and therefore, they can't be used to change the formatting of other lexical units.

In the languages where the character `$` does not play a important role, it's possible to activate that mechanism “`escape-math`” with the character `$`:

```
\PitonOptions{begin-escape-math=$,end-escape-math=$}
```

Remark that the character `$` must *not* be protected by a backslash.

However, it's probably more prudent to use `\(` et `\)`.

```
\PitonOptions{begin-escape-math=\(,end-escape-math=\)}
```

Here is an example of utilisation.

```
\begin{Piton}[line-numbers]
def arctan(x,n=10):
    if \(x < 0\) :
        return \(-\arctan(-x)\)
    elif \(x > 1\) :
        return \(\pi/2 - \arctan(1/x)\)
    else:
        s = \(0\)
        for \(k\) in range(\(n\)): s += \(\smash{\frac{(-1)^k}{2k+1} x^{2k+1}}\)
        return s
\end{Piton}
```

```

1 def arctan(x,n=10):
2     if x < 0 :
3         return -arctan(-x)
4     elif x > 1 :
5         return  $\pi/2 - \arctan(1/x)$ 
6     else:
7         s = 0
8         for k in range(n): s +=  $\frac{(-1)^k}{2k+1}x^{2k+1}$ 
9         return s

```

## 5.5 Behaviour in the class Beamer

*First remark*

Since the environment `{Piton}` catches its body with a verbatim mode, it's necessary to use the environments `{Piton}` within environments `{frame}` of Beamer protected by the key `fragile`, i.e. beginning with `\begin{frame}[fragile]`.<sup>22</sup>

When the package `piton` is used within the class `beamer`<sup>23</sup>, the behaviour of `piton` is slightly modified, as described now.

### 5.5.1 `{Piton}` et `\PitonInputFile` are “overlay-aware”

When `piton` is used in the class `beamer`, the environment `{Piton}` and the command `\PitonInputFile` accept the optional argument `<...>` of Beamer for the overlays which are involved.

For example, it's possible to write:

```
\begin{Piton}<2-5>
```

```
...
```

```
\end{Piton}
```

and

```
\PitonInputFile<2-5>{my_file.py}
```

### 5.5.2 Commands of Beamer allowed in `{Piton}` and `\PitonInputFile`

When `piton` is used in the class `beamer`, the following commands of `beamer` (classified upon their number of arguments) are automatically detected in the environments `{Piton}` (and in the listings processed by `\PitonInputFile`):

- no mandatory argument : `\pause`<sup>24</sup> ;
- one mandatory argument : `\action`, `\alert`, `\invisible`, `\only`, `\uncover` and `\visible` ;
- two mandatory arguments : `\alt` ;
- three mandatory arguments : `\temporal`.

In the mandatory arguments of these commands, the braces must be balanced. However, the braces included in short strings<sup>25</sup> of Python are not considered.

Regarding the fonctions `\alt` and `\temporal` there should be no carriage returns in the mandatory arguments of these functions.

Here is a complete example of file:

<sup>22</sup>Remind that for an environment `{frame}` of Beamer using the key `fragile`, the instruction `\end{frame}` must be alone on a single line (except for any leading whitespace).

<sup>23</sup>The extension `piton` detects the class `beamer` and the package `beamerarticle` if it is loaded previously but, if needed, it's also possible to activate that mechanism with the key `beamer` provided by `piton` at load-time: `\usepackage[beamer]{piton}`

<sup>24</sup>One should remark that it's also possible to use the command `\pause` in a “LaTeX comment”, that is to say by writing `#> \pause`. By this way, if the Python code is copied, it's still executable by Python

<sup>25</sup>The short strings of Python are the strings delimited by characters `'` or the characters `"` and not `'''` nor `"""`. In Python, the short strings can't extend on several lines.

```

\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def string_of_list(l):
    """Convert a list of numbers in string"""
    \only<2->{s = "{" + str(l[0])}
    \only<3->{for x in l[1:]: s = s + "," + str(x)}
    \only<4->{s = s + "}"}
    return s
\end{Piton}
\end{frame}
\end{document}

```

In the previous example, the braces in the Python strings "{" and "}" are correctly interpreted (without any escape character).

### 5.5.3 Environments of Beamer allowed in {Piton} and \PitonInputFile

When `piton` is used in the class `beamer`, the following environments of Beamer are directly detected in the environments `{Piton}` (and in the listings processed by `\PitonInputFile`): `{actionenv}`, `{alertenv}`, `{invisibleenv}`, `{onlyenv}`, `{uncoverenv}` and `{visibleenv}`.

However, there is a restriction: these environments must contain only *whole lines of Python code* in their body.

Here is an example:

```

\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def square(x):
    """Compute the square of its argument"""
    \begin{uncoverenv}<2>
    return x*x
    \end{uncoverenv}
\end{Piton}
\end{frame}
\end{document}

```

#### Remark concerning the command `\alert` and the environment `{alertenv}` of Beamer

Beamer provides an easy way to change the color used by the environment `{alertenv}` (and by the command `\alert` which relies upon it) to highlight its argument. Here is an example:

```
\setbeamercolor{alerted text}{fg=blue}
```

However, when used inside an environment `{Piton}`, such tuning will probably not be the best choice because `piton` will, by design, change (most of the time) the color the different elements of text. One may prefer an environment `{alertenv}` that will change the background color for the elements to be highlighted.

Here is a code that will do that job and add a yellow background. That code uses the command `\@highLight` of `lua-ul` (that extension requires also the package `luacolor`).

```

\setbeamercolor{alerted text}{bg=yellow!50}
\makeatletter
\AddToHook{env/Piton/begin}
  {\renewenvironment<>{alertenv}{\only#1{\@highLight[alerted text.bg]}}{}}
\makeatother

```

That code redefines locally the environment `{alertenv}` within the environments `{Piton}` (we recall that the command `\alert` relies upon that environment `{alertenv}`).

## 5.6 Footnotes in the environments of `piton`

If you want to put footnotes in an environment `{Piton}` or (or, more unlikely, in a listing produced by `\PitonInputFile`), you can use a pair `\footnotemark`–`\footnotetext`.

However, it's also possible to extract the footnotes with the help of the package `footnote` or the package `footnotehyper`.

If `piton` is loaded with the option `footnote` (with `\usepackage[footnote]{piton}` or with `\PassOptionsToPackage`), the package `footnote` is loaded (if it is not yet loaded) and it is used to extract the footnotes.

If `piton` is loaded with the option `footnotehyper`, the package `footnotehyper` is loaded (if it is not yet loaded) and it is used to extract footnotes.

Caution: The packages `footnote` and `footnotehyper` are incompatible. The package `footnotehyper` is the successor of the package `footnote` and should be used preferently. The package `footnote` has some drawbacks, in particular: it must be loaded after the package `xcolor` and it is not perfectly compatible with `hyperref`.

In this document, the package `piton` has been loaded with the option `footnotehyper`. For examples of notes, cf. 7.3, p. 20.

## 5.7 Tabulations

Even though it's recommended to indent the Python listings with spaces (see PEP 8), `piton` accepts the characters of tabulation (that is to say the characters U+0009) at the beginning of the lines. Each character U+0009 is replaced by  $n$  spaces. The initial value of  $n$  is 4 but it's possible to change it with the key `tab-size` of `\PitonOptions`.

There exists also a key `tabs-auto-gobble` which computes the minimal value  $n$  of the number of consecutive characters U+0009 beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of  $n$  (before replacement of the tabulations by spaces, of course). Hence, that key is similar to the key `auto-gobble` but acts on U+0009 instead of U+0020 (spaces).

## 6 API for the developers

The L3 variable `\l_piton_language_str` contains the name of the current language of `piton` (in lower case).

### New 2.6

The extension `piton` provides a Lua function `piton.get_last_code` without argument which returns the code in the latest environment of `piton`.

- The carriage returns (which are present in the initial environment) appears as characters `\r` (i.e. U+000D).
- The code returned by `piton.get_last_code()` takes into account the potential application of a key `gobble`, `auto-gobble` or `env-gobble` (cf. p. 3).
- The extra formatting elements added in the code are deleted in the code returned by `piton.get_last_code()`. That concerns the LaTeX commands declared by the key `detected-commands` (cf. part 5.4.3) and the elements inserted by the mechanism “escape” (cf. part 5.4.4).
- `piton.get_last_code` is a Lua function and not a Lua string: the treatments outlined above are executed when the function is called. Therefore, it might be judicious to store the value returned by `piton.get_last_code()` in a variable of Lua if it will be used several times.

For an example of use, see the part concerning `pyluatex`, part 7.5, p. 22.

## 7 Examples

### 7.1 Line numbering

We remind that it's possible to have an automatic numbering of the lines in the Python listings by using the key `line-numbers`.

By default, the numbers of the lines are composed by `piton` in an overlapping position on the left (by using internally the command `\llap` of LaTeX).

In order to avoid that overlapping, it's possible to use the option `left-margin=auto` which will insert automatically a margin adapted to the numbers of lines that will be written (that margin is larger when the numbers are greater than 10).

```
\PitonOptions{background-color=gray!10, left-margin = auto, line-numbers}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> (recursive call)
    elif x > 1:
        return pi/2 - arctan(1/x) #> (other recursive call)
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}
```

```
1 def arctan(x,n=10):
2     if x < 0:
3         return -arctan(-x)          (recursive call)
4     elif x > 1:
5         return pi/2 - arctan(1/x) (other recursive call)
6     else:
7         return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

### 7.2 Formatting of the LaTeX comments

It's possible to modify the style `Comment.LaTeX` (with `\SetPitonStyle`) in order to display the LaTeX comments (which begin with `#>`) aligned on the right margin.

```
\PitonOptions{background-color=gray!10}
\SetPitonStyle{Comment.LaTeX = \hfill \normalfont\color{gray}}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> other recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}
```

```
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)  another recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

It's also possible to display these LaTeX comments in a kind of second column by limiting the width of the Python code with the key `width`. In the following example, we use the key `width` with the special value `min`. Several compilations are required.

```

\PytonOptions{background-color=gray!10, width=min}
\NewDocumentCommand{\MyLaTeXCommand}{m}{\hfill \normalfont\itshape\rlap{\quad #1}}
\SetPytonStyle{Comment.LaTeX = \MyLaTeXCommand}
\begin{Pyton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x) #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
\end{Pyton}

```

```

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)
    elif x > 1:
        return pi/2 - arctan(1/x)
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s

```

*recursive call*

*another recursive call*

### 7.3 Notes in the listings

In order to be able to extract the notes (which are typeset with the command `\footnote`), the extension `piton` must be loaded with the key `footnote` or the key `footnotehyper` as explained in the section 5.6 p. 18. In this document, the extension `piton` has been loaded with the key `footnotehyper`. Of course, in an environment `{Pyton}`, a command `\footnote` may appear only within a LaTeX comment (which begins with `#>`). It's possible to have comments which contain only that command `\footnote`. That's the case in the following example.

```

\PytonOptions{background-color=gray!10}
\begin{Pyton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)#>\footnote{First recursive call.}]
    elif x > 1:
        return pi/2 - arctan(1/x)#>\footnote{Second recursive call.}]
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Pyton}

```

```

def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)26
    elif x > 1:
        return pi/2 - arctan(1/x)27
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )

```

---

<sup>26</sup>First recursive call.

<sup>27</sup>Second recursive call.

If an environment `{Piton}` is used in an environment `{minipage}` of LaTeX, the notes are composed, of course, at the foot of the environment `{minipage}`. Recall that such `{minipage}` can't be broken by a page break.

```
\PitonOptions{background-color=gray!10}
\emphse\begin{minipage}{\linewidth}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)#>\footnote{First recursive call.}
    elif x > 1:
        return pi/2 - arctan(1/x)#>\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}
\end{minipage}
```

```
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)a
    elif x > 1:
        return pi/2 - arctan(1/x)b
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

---

<sup>a</sup>First recursive call.

<sup>b</sup>Second recursive call.

## 7.4 An example of tuning of the styles

The graphical styles have been presented in the section 4.2, p. 6.

We present now an example of tuning of these styles adapted to the documents in black and white. We use the font *DejaVu Sans Mono*<sup>28</sup> specified by the command `\setmonofont` of `fontspec`. That tuning uses the command `\highLight` of `lua-ul` (that package requires itself the package `luacolor`).

```
\setmonofont[Scale=0.85]{DejaVu Sans Mono}

\SetPitonStyle
{
    Number = ,
    String = \itshape ,
    String.Doc = \color{gray} \slshape ,
    Operator = ,
    Operator.Word = \bfseries ,
    Name.Builtin = ,
    Name.Function = \bfseries \highLight[gray!20] ,
    Comment = \color{gray} ,
    Comment.LaTeX = \normalfont \color{gray},
    Keyword = \bfseries ,
    Name.Namespace = ,
    Name.Class = ,
    Name.Type = ,
    InitialValues = \color{gray}
}
```

In that tuning, many values given to the keys are empty: that means that the corresponding style won't insert any formatting instruction (the element will be composed in the standard color, usually

---

<sup>28</sup>See: <https://dejavu-fonts.github.io>

in black, etc.). Nevertheless, those entries are mandatory because the initial value of those keys in `piton` is *not* empty.

```
from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
        (we have used that arctan(x) + arctan(1/x) = pi/2 for x > 0)
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
```

## 7.5 Use with `pyluatex`

The package `pyluatex` is an extension which allows the execution of some Python code from `lualatex` (provided that Python is installed on the machine and that the compilation is done with `lualatex` and `--shell-escape`).

Here is, for example, an environment `{PitonExecute}` which formats a Python listing (with `piton`) but also displays the output of the execution of the code with Python.

```
\NewPitonEnvironment{PitonExecute}{!0{}}
{\PitonOptions{#1}}
{\begin{center}
  \directlua{pyluatex.execute(piton.get_last_code(), false, true, false, true)}%
  \end{center}
  \ignorespacesafterend}
```

We have used the Lua function `piton.get_last_code` provided in the API of `piton` : cf. part 6, p. 18.

This environment `{PitonExecute}` takes in as optional argument (between square brackets) the options of the command `\PitonOptions`.

## 8 The styles for the different computer languages

### 8.1 The language Python

In `piton`, the default language is Python. If necessary, it's possible to come back to the language Python with `\PitonOptions{language=Python}`.

The initial settings done by `piton` in `piton.sty` are inspired by the style `manni` de Pygments, as applied by Pygments to the language Python.<sup>29</sup>

---

Style	Use
Number	the numbers
String.Short	the short strings (entre ' ou ")
String.Long	the long strings (entre '' ou """) excepted the doc-strings (governed by <code>String.Doc</code> )
String	that key fixes both <code>String.Short</code> et <code>String.Long</code>
String.Doc	the doc-strings (only with "" following PEP 257)
String.Interpol	the syntactic elements of the fields of the f-strings (that is to say the characters { et }); that style inherits for the styles <code>String.Short</code> and <code>String.Long</code> (according the kind of string where the interpolation appears)
Interpol.Inside	the content of the interpolations in the f-strings (that is to say the elements between { and }); if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
Operator	the following operators: != == << >> - ~ + / * % = < > & .   @
Operator.Word	the following operators: <code>in</code> , <code>is</code> , <code>and</code> , <code>or</code> et <code>not</code>
Name.Builtin	almost all the functions predefined by Python
Name.Decorator	the decorators (instructions beginning by @)
Name.Namespace	the name of the modules
Name.Class	the name of the Python classes defined by the user <i>at their point of definition</i> (with the keyword <code>class</code> )
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword <code>def</code> )
UserFunction	the name of the Python functions previously defined by the user (the initial value of that parameter is empty and, hence, these elements are drawn, by default, in the current color, usually black)
Exception	les exceptions prédéfinies (ex.: <code>SyntaxError</code> )
InitialValues	the initial values (and the preceding symbol =) of the optional arguments in the definitions of functions; if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
Comment	the comments beginning with #
Comment.LaTeX	the comments beginning with #>, which are composed by <code>piton</code> as LaTeX code (merely named “LaTeX comments” in this document)
Keyword.Constant	<code>True</code> , <code>False</code> et <code>None</code>
Keyword	the following keywords: <code>assert</code> , <code>break</code> , <code>case</code> , <code>continue</code> , <code>del</code> , <code>elif</code> , <code>else</code> , <code>except</code> , <code>exec</code> , <code>finally</code> , <code>for</code> , <code>from</code> , <code>global</code> , <code>if</code> , <code>import</code> , <code>lambda</code> , <code>non local</code> , <code>pass</code> , <code>raise</code> , <code>return</code> , <code>try</code> , <code>while</code> , <code>with</code> , <code>yield</code> et <code>yield from</code> .

---

<sup>29</sup>See: <https://pygments.org/styles/>. Remark that, by default, Pygments provides for its style `manni` a colored background whose color is the HTML color `#F0F3F3`. It's possible to have the same color in `{Piton}` with the instruction `\PitonOptions{background-color = [HTML]{F0F3F3}}`.

## 8.2 The language OCaml

It's possible to switch to the language OCaml with `\PitonOptions{language = OCaml}`.

It's also possible to set the language OCaml for an individual environment `{Piton}`.

```
\begin{Piton}[language=OCaml]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=OCaml]{...}`

Style	Use
Number	the numbers
String.Short	the characters (between ')
String.Long	the strings, between " but also the <i>quoted-strings</i>
String	that key fixes both <code>String.Short</code> and <code>String.Long</code>
Operator	les opérateurs, en particulier +, -, /, *, @, !=, ==, &&
Operator.Word	les opérateurs suivants : <code>and</code> , <code>asr</code> , <code>land</code> , <code>lor</code> , <code>lsl</code> , <code>lxor</code> , <code>mod</code> et <code>or</code>
Name.Builtin	les fonctions <code>not</code> , <code>incr</code> , <code>decr</code> , <code>fst</code> et <code>snd</code>
Name.Type	the name of a type of OCaml
Name.Field	the name of a field of a module
Name.Constructor	the name of the constructors of types (which begins by a capital)
Name.Module	the name of the modules
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword <code>let</code> )
UserFunction	the name of the OCaml functions previously defined by the user (the initial value of that parameter is empty and these elements are drawn in the current color, usually black)
Exception	the predefined exceptions (eg : <code>End_of_File</code> )
TypeParameter	the parameters of the types
Comment	the comments, between (* et *); these comments may be nested
Keyword.Constant	<code>true</code> et <code>false</code>
Keyword	the following keywords: <code>assert</code> , <code>as</code> , <code>begin</code> , <code>class</code> , <code>constraint</code> , <code>done</code> , <code>downto</code> , <code>do</code> , <code>else</code> , <code>end</code> , <code>exception</code> , <code>external</code> , <code>for</code> , <code>function</code> , <code>functor</code> , <code>fun</code> , <code>if</code> , <code>include</code> , <code>inherit</code> , <code>initializer</code> , <code>in</code> , <code>lazy</code> , <code>let</code> , <code>match</code> , <code>method</code> , <code>module</code> , <code>mutable</code> , <code>new</code> , <code>object</code> , <code>of</code> , <code>open</code> , <code>private</code> , <code>raise</code> , <code>rec</code> , <code>sig</code> , <code>struct</code> , <code>then</code> , <code>to</code> , <code>try</code> , <code>type</code> , <code>value</code> , <code>val</code> , <code>virtual</code> , <code>when</code> , <code>while</code> and <code>with</code>

### 8.3 The language C (and C++)

It's possible to switch to the language C with `\PitonOptions{language = C}`.

It's also possible to set the language C for an individual environment `{Piton}`.

```
\begin{Piton}[language=C]
...
\end{Piton}
```

The option exists also for `\PitonInputFile : \PitonInputFile[language=C]{...}`

Style	Use
Number	the numbers
String.Long	the strings (between ")
String.Interpol	the elements %d, %i, %f, %c, etc. in the strings; that style inherits from the style String.Long
Operator	the following operators : != == << >> - ~ + / * % = < > & .   @
Name.Type	the following predefined types: bool, char, char16_t, char32_t, double, float, int, int8_t, int16_t, int32_t, int64_t, long, short, signed, unsigned, void et wchar_t
Name.Builtin	the following predefined functions: printf, scanf, malloc, sizeof and alignof
Name.Class	le nom des classes au moment de leur définition, c'est-à-dire après le mot-clé class
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword let)
UserFunction	the name of the Python functions previously defined by the user (the initial value of that parameter is empty and these elements are drawn in the current color, usually black)
Preproc	the instructions of the preprocessor (beginning par #)
Comment	the comments (beginning by // or between /* and */)
Comment.LaTeX	the comments beginning by //> which are composed by piton as LaTeX code (merely named "LaTeX comments" in this document)
Keyword.Constant	default, false, NULL, nullptr and true
Keyword	the following keywords: alignas, asm, auto, break, case, catch, class, constexpr, const, continue, decltype, do, else, enum, extern, for, goto, if, noexcept, private, public, register, restricted, try, return, static, static_assert, struct, switch, thread_local, throw, typedef, union, using, virtual, volatile and while

## 8.4 The language SQL

It's possible to switch to the language SQL with `\PitonOptions{language = SQL}`.

It's also possible to set the language SQL for an individual environment `{Piton}`.

```
\begin{Piton}[language=SQL]
...
\end{Piton}
```

The option exists also for `\PitonInputFile` : `\PitonInputFile[language=SQL]{...}`

Style	Use
Number	the numbers
String.Long	the strings (between ' and not " because the elements between " are names of fields and formatted with <code>Name.Field</code> )
Operator	the following operators : = != <> >= > < <= * + /
Name.Table	the names of the tables
Name.Field	the names of the fields of the tables
Name.Builtin	the following built-in functions (their names are <i>not</i> case-sensitive): <code>avg, count, char_lenght, concat, curdate, current_date, date_format, day, lower, ltrim, max, min, month, now, rank, round, rtrim, substring, sum, upper</code> and <code>year</code> .
Comment	the comments (beginning by <code>--</code> or between <code>/*</code> and <code>*/</code> )
Comment.LaTeX	the comments beginning by <code>--&gt;</code> which are composed by <code>piton</code> as LaTeX code (merely named "LaTeX comments" in this document)
Keyword	the following keywords (their names are <i>not</i> case-sensitive): <code>add, after, all, alter, and, as, asc, between, by, change, column, create, cross join, delete, desc, distinct, drop, from, group, having, in, inner, insert, into, is, join, left, like, limit, merge, not, null, on, or, order, over, right, select, set, table, then, truncate, union, update, values, when, where</code> and <code>with</code> .

It's possible to automatically capitalize the keywords by modifying locally for the language SQL the style `Keywords`.

```
\SetPitonStyle[SQL]{Keywords = \bfseries \MakeUppercase}
```

## 8.5 The language “minimal”

It’s possible to switch to the language “minimal” with `\PitonOptions{language = minimal}`.

It’s also possible to set the language “minimal” for an individual environment `{Piton}`.

```
\begin{Piton}[language=minimal]
...
\end{Piton}
```

The option exists also for `\PitonInputFile` : `\PitonInputFile[language=minimal]{...}`

Style	Usage
<b>Number</b>	the numbers
<b>String</b>	the strings (between ")
<b>Comment</b>	the comments (which begin with #)
<b>Comment.LaTeX</b>	the comments beginning with #>, which are composed by <code>piton</code> as LaTeX code (merely named “LaTeX comments” in this document)

That language is provided for the final user who might wish to add keywords in that language (with the command `\SetPitonIdentifier`: cf. 5.3, p. 12) in order to create, for example, a language for pseudo-code.

## 9 Implementation

The development of the extension `piton` is done on the following GitHub depot:  
<https://github.com/fpantigny/piton>

### 9.1 Introduction

The main job of the package `piton` is to take in as input a Python listing and to send back to LaTeX as output that code *with interlaced LaTeX instructions of formatting*.

In fact, all that job is done by a LPEG called `python`. That LPEG, when matched against the string of a Python listing, returns as capture a Lua table containing data to send to LaTeX. The only thing to do after will be to apply `tex.tprint` to each element of that table.<sup>30</sup>

Consider, for example, the following Python code:

```
def parity(x):  
    return x%2
```

The capture returned by the lpeg `python` against that code is the Lua table containing the following elements :

```
{ "\\_piton_begin_line:" }a  
{ "{\PitonStyle{Keyword}{ " } }b  
{ luatexbase.catcodetables.CatcodeTableOtherc, "def" }  
{ "}" }  
{ luatexbase.catcodetables.CatcodeTableOther, " " }  
{ "{\PitonStyle{Name.Function}{ " }  
{ luatexbase.catcodetables.CatcodeTableOther, "parity" }  
{ "}" }  
{ luatexbase.catcodetables.CatcodeTableOther, "(" }  
{ luatexbase.catcodetables.CatcodeTableOther, "x" }  
{ luatexbase.catcodetables.CatcodeTableOther, ")" }  
{ luatexbase.catcodetables.CatcodeTableOther, ":" }  
{ "\\_piton_end_line: \\_piton_newline: \\_piton_begin_line:" }  
{ luatexbase.catcodetables.CatcodeTableOther, " " }  
{ "{\PitonStyle{Keyword}{ " }  
{ luatexbase.catcodetables.CatcodeTableOther, "return" }  
{ "}" }  
{ luatexbase.catcodetables.CatcodeTableOther, " " }  
{ luatexbase.catcodetables.CatcodeTableOther, "x" }  
{ "{\PitonStyle{Operator}{ " }  
{ luatexbase.catcodetables.CatcodeTableOther, "&" }  
{ "}" }  
{ "{\PitonStyle{Number}{ " }  
{ luatexbase.catcodetables.CatcodeTableOther, "2" }  
{ "}" }  
{ "\\_piton_end_line:" }
```

---

<sup>a</sup>Each line of the Python listings will be encapsulated in a pair: `\_begin_line: - \_end_line:`. The token `\_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\_begin_line:`. Both tokens `\_begin_line:` and `\_end_line:` will be nullified in the command `\piton` (since there can't be lines breaks in the argument of a command `\piton`).

<sup>b</sup>The lexical elements of Python for which we have a `piton` style will be formatted via the use of the command `\PitonStyle`. Such an element is typeset in LaTeX via the syntax `{\PitonStyle{style}{...}}` because the instructions inside an `\PitonStyle` may be both semi-global declarations like `\bfseries` and commands with one argument like `\fbox`.

<sup>c</sup>`luatexbase.catcodetables.CatcodeTableOther` is a mere number which corresponds to the “catcode table” whose all characters have the catcode “other” (which means that they will be typeset by LaTeX verbatim).

---

<sup>30</sup>Recall that `tex.tprint` takes in as argument a Lua table whose first component is a “catcode table” and the second element a string. The string will be sent to LaTeX with the regime of catcodes specified by the catcode table. If no catcode table is provided, the standard catcodes of LaTeX will be used.

We give now the LaTeX code which is sent back by Lua to TeX (we have written on several lines for legibility but no character `\r` will be sent to LaTeX). The characters which are greyed-out are sent to LaTeX with the catcode “other” (=12). All the others characters are sent with the regime of catcodes of L3 (as set by `\ExplSyntaxOn`)

```

\__piton_begin_line:{\PitonStyle{Keyword}{def}}
\__piton_end_line:\__piton_newline:
\__piton_begin_line:\__piton_end_line:
\__piton_end_line:\__piton_newline:
\__piton_end_line:\__piton_newline:

```

## 9.2 The L3 part of the implementation

### 9.2.1 Declaration of the package

```

1  (*STY)
2  \NeedsTeXFormat{LaTeX2e}
3  \RequirePackage{l3keys2e}
4  \ProvidesExplPackage
5    {piton}
6    {\PitonFileDate}
7    {\PitonFileVersion}
8    {Highlight informatic listings with LPEG on LuaLaTeX}

9  \cs_new_protected:Npn \@@_error:n { \msg_error:nn { piton } }
10 \cs_new_protected:Npn \@@_warning:n { \msg_warning:nn { piton } }
11 \cs_new_protected:Npn \@@_error:nn { \msg_error:nnn { piton } }
12 \cs_new_protected:Npn \@@_error:nnn { \msg_error:nnnn { piton } }
13 \cs_new_protected:Npn \@@_fatal:n { \msg_fatal:nn { piton } }
14 \cs_new_protected:Npn \@@_fatal:nn { \msg_fatal:nnn { piton } }
15 \cs_new_protected:Npn \@@_msg_new:nn { \msg_new:nnn { piton } }
16 \cs_new_protected:Npn \@@_gredirect_none:n #1
17   {
18     \group_begin:
19     \globaldefs = 1
20     \msg_redirect_name:nnn { piton } { #1 } { none }
21     \group_end:
22   }

```

With Overleaf, by default, a document is compiled in non-stop mode. When there is an error, there is no way to the user to use the key H in order to have more information. That’s why we decide to put that piece of information (for the messages with such information) in the main part of the message when the key `messages-for-Overleaf` is used (at load-time).

```

23 \cs_new_protected:Npn \@@_msg_new:nnn #1 #2 #3
24   {
25     \bool_if:NTF \g_@@_messages_for_Overleaf_bool
26       { \msg_new:nnn { piton } { #1 } { #2 } { #3 } }
27       { \msg_new:nnnn { piton } { #1 } { #2 } { #3 } }
28   }

```

We also create a command which will generate usually an error but only a warning on Overleaf. The argument is given by curryfication.

```

29 \cs_new_protected:Npn \@@_error_or_warning:n
30   { \bool_if:NTF \g_@@_messages_for_Overleaf_bool \@@_warning:n \@@_error:n }

```

We try to detect whether the compilation is done on Overleaf. We use `\c_sys_jobname_str` because, with Overleaf, the value of `\c_sys_jobname_str` is always “output”.

```

145   piton.last_language = ''
146 }

```

## 9.2.2 Parameters and technical definitions

The following string will contain the name of the informatic language considered (the initial value is `python`).

```

147 \str_new:N \l_piton_language_str
148 \str_set:Nn \l_piton_language_str { python }

```

Each time the command `\PitonInputFile` of `piton` is used, the code of that environment will be stored in the following global string.

```

149 \tl_new:N \g_piton_last_code_tl

```

The following parameter corresponds to the key `path` (which is the path used to include files by `\PitonInputFile`).

```

150 \str_new:N \l_@@_path_str

```

The following parameter corresponds to the key `path-write` (which is the path used when writing files from listings inserted in the environments of `piton` by use of the key `write`).

```

151 \str_new:N \l_@@_path_write_str

```

In order to have a better control over the keys.

```

152 \bool_new:N \l_@@_in_PitonOptions_bool
153 \bool_new:N \l_@@_in_PitonInputFile_bool

```

We will compute (with Lua) the numbers of lines of the Python code and store it in the following counter.

```

154 \int_new:N \l_@@_nb_lines_int

```

The same for the number of non-empty lines of the Python codes.

```

155 \int_new:N \l_@@_nb_non_empty_lines_int

```

The following counter will be used to count the lines during the composition. It will count all the lines, empty or not empty. It won't be used to print the numbers of the lines.

```

156 \int_new:N \g_@@_line_int

```

The following token list will contain the (potential) informations to write on the `aux` (to be used in the next compilation).

```

157 \tl_new:N \g_@@_aux_tl

```

The following counter corresponds to the key `splittable` of `\PitonOptions`. If the value of `\l_@@_splittable_int` is equal to  $n$ , then no line break can occur within the first  $n$  lines or the last  $n$  lines of the listings.

```

158 \int_new:N \l_@@_splittable_int

```

When the key `split-on-empty-lines` will be in force, then the following token list will be inserted between the chunks of code (the informatic code provided by the final user is split in chunks on the empty lines in the code).

```
159 \tl_new:N \l_@@_split_separation_tl
160 \tl_set:Nn \l_@@_split_separation_tl { \vspace{\baselineskip} \vspace{-1.25pt} }
```

An initial value of `splittable` equal to 100 is equivalent to say that the environments `{Piton}` are unbreakable.

```
161 \int_set:Nn \l_@@_splittable_int { 100 }
```

The following string corresponds to the key `background-color` of `\PitonOptions`.

```
162 \clist_new:N \l_@@_bg_color_clist
```

The package `piton` will also detect the lines of code which correspond to the user input in a Python console, that is to say the lines of code beginning with `>>>` and `....`. It's possible, with the key `prompt-background-color`, to require a background for these lines of code (and the other lines of code will have the standard background color specified by `background-color`).

```
163 \tl_new:N \l_@@_prompt_bg_color_tl
```

The following parameters correspond to the keys `begin-range` and `end-range` of the command `\PitonInputFile`.

```
164 \str_new:N \l_@@_begin_range_str
165 \str_new:N \l_@@_end_range_str
```

The argument of `\PitonInputFile`.

```
166 \str_new:N \l_@@_file_name_str
```

We will count the environments `{Piton}` (and, in fact, also the commands `\PitonInputFile`, despite the name `\g_@@_env_int`).

```
167 \int_new:N \g_@@_env_int
```

The parameter `\l_@@_writer_str` corresponds to the key `write`. We will store the list of the files already used in `\g_@@_write_seq` (we must not erase a file which has been still been used).

```
168 \str_new:N \l_@@_write_str
169 \seq_new:N \g_@@_write_seq
```

The following boolean corresponds to the key `show-spaces`.

```
170 \bool_new:N \l_@@_show_spaces_bool
```

The following booleans correspond to the keys `break-lines` and `indent-broken-lines`.

```
171 \bool_new:N \l_@@_break_lines_in_Piton_bool
172 \bool_new:N \l_@@_indent_broken_lines_bool
```

The following token list corresponds to the key `continuation-symbol`.

```
173 \tl_new:N \l_@@_continuation_symbol_tl
174 \tl_set:Nn \l_@@_continuation_symbol_tl { + }
```

The following token list corresponds to the key `continuation-symbol-on-indentation`. The name has been shorten to `csoi`.

```
175 \tl_new:N \l_@@_csoi_tl
176 \tl_set:Nn \l_@@_csoi_tl { $ \hookrightarrow \; $ }
```

The following token list corresponds to the key `end-of-broken-line`.

```
177 \tl_new:N \l_@@_end_of_broken_line_tl
178 \tl_set:Nn \l_@@_end_of_broken_line_tl { \hspace*{0.5em} \textbackslash }
```

The following boolean corresponds to the key `break-lines-in-piton`.

```
179 \bool_new:N \l_@@_break_lines_in_piton_bool
```

The following dimension will be the width of the listing constructed by `{Piton}` or `\PitonInputFile`.

- If the user uses the key `width` of `\PitonOptions` with a numerical value, that value will be stored in `\l_@@_width_dim`.
- If the user uses the key `width` with the special value `min`, the dimension `\l_@@_width_dim` will, *in the second run*, be computed from the value of `\l_@@_line_width_dim` stored in the `aux` file (computed during the first run the maximal width of the lines of the listing). During the first run, `\l_@@_width_line_dim` will be set equal to `\linewidth`.
- Elsewhere, `\l_@@_width_dim` will be set at the beginning of the listing (in `\@@_pre_env:`) equal to the current value of `\linewidth`.

```
180 \dim_new:N \l_@@_width_dim
```

We will also use another dimension called `\l_@@_line_width_dim`. That will be the width of the actual lines of code. That dimension may be lower than the whole `\l_@@_width_dim` because we have to take into account the value of `\l_@@_left_margin_dim` (for the numbers of lines when `line-numbers` is in force) and another small margin when a background color is used (with the key `background-color`).

```
181 \dim_new:N \l_@@_line_width_dim
```

The following flag will be raised with the key `width` is used with the special value `min`.

```
182 \bool_new:N \l_@@_width_min_bool
```

If the key `width` is used with the special value `min`, we will compute the maximal width of the lines of an environment `{Piton}` in `\g_@@_tmp_width_dim` because we need it for the case of the key `width` is used with the special value `min`. We need a global variable because, when the key `footnote` is in force, each line when be composed in an environment `{savenotes}` and we need to exit our `\g_@@_tmp_width_dim` from that environment.

```
183 \dim_new:N \g_@@_tmp_width_dim
```

The following dimension corresponds to the key `left-margin` of `\PitonOptions`.

```
184 \dim_new:N \l_@@_left_margin_dim
```

The following boolean will be set when the key `left-margin=auto` is used.

```
185 \bool_new:N \l_@@_left_margin_auto_bool
```

The following dimension corresponds to the key `numbers-sep` of `\PitonOptions`.

```
186 \dim_new:N \l_@@_numbers_sep_dim
187 \dim_set:Nn \l_@@_numbers_sep_dim { 0.7 em }
```

The tabulators will be replaced by the content of the following token list.

```
188 \tl_new:N \l_@@_tab_tl
```

Be careful. The following sequence `\g_@@_languages_seq` is not the list of the languages supported by `piton`. It's the list of the languages for which at least a user function has been defined. We need that sequence only for the command `\PitonClearUserFunctions` when it is used without its optional argument: it must clear all the list of languages for which at least a user function has been defined.

```
189 \seq_new:N \g_@@_languages_seq

190 \cs_new_protected:Npn \@@_set_tab_tl:n #1
191 {
192   \tl_clear:N \l_@@_tab_tl
193   \prg_replicate:nn { #1 }
194     { \tl_put_right:Nn \l_@@_tab_tl { ~ } }
195 }
196 \@@_set_tab_tl:n { 4 }
```

When the key `show-spaces` is in force, `\l_@@_tab_tl` will be replaced by an arrow by using the following command.

```

197 \cs_new_protected:Npn \@@_convert_tab_tl:
198   {
199     \hbox_set:Nn \l_tmpa_box { \l_@@_tab_tl }
200     \dim_set:Nn \l_tmpa_dim { \box_wd:N \l_tmpa_box }
201     \tl_set:Nn \l_@@_tab_tl
202       {
203         \(\mathcolor { gray }
204           { \hbox_to_wd:nn \l_tmpa_dim { \rightarrowfill } \} ) }
205       }
206   }

```

The following integer corresponds to the key `gobble`.

```

207 \int_new:N \l_@@_gobble_int

```

The following token list will be used only for the spaces in the strings.

```

208 \tl_new:N \l_@@_space_tl
209 \tl_set_eq:NN \l_@@_space_tl \nobreakspace

```

At each line, the following counter will count the spaces at the beginning.

```

210 \int_new:N \g_@@_indentation_int

211 \cs_new_protected:Npn \@@_an_indentation_space:
212   { \int_gincr:N \g_@@_indentation_int }

```

The following command `\@@_beamer_command:n` executes the argument corresponding to its argument but also stores it in `\l_@@_beamer_command_str`. That string is used only in the error message “`cr~not~allowed`” raised when there is a carriage return in the mandatory argument of that command.

```

213 \cs_new_protected:Npn \@@_beamer_command:n #1
214   {
215     \str_set:Nn \l_@@_beamer_command_str { #1 }
216     \use:c { #1 }
217   }

```

In the environment `{Piton}`, the command `\label` will be linked to the following command.

```

218 \cs_new_protected:Npn \@@_label:n #1
219   {
220     \bool_if:NTF \l_@@_line_numbers_bool
221       {
222         \@bsphack
223         \protected@write \@auxout { }
224           {
225             \string \newlabel { #1 }
226           }

```

Remember that the content of a line is typeset in a box *before* the composition of the potential number of line.

```

227           { \int_eval:n { \g_@@_visual_line_int + 1 } }
228           { \thepage }
229         }
230       }
231     \@esphack
232   }
233   { \@@_error:n { label~with~lines~numbers } }
234 }

```

The following commands corresponds to the keys `marker/beginning` and `marker/end`. The values of that keys are functions that will be applied to the “*range*” specified by the final user in an individual `\PitonInputFile`. They will construct the markers used to find textually in the external file loaded by `piton` the part which must be included (and formatted).

```
235 \cs_new_protected:Npn \@@_marker_beginning:n #1 { }
236 \cs_new_protected:Npn \@@_marker_end:n #1 { }
```

The following commands are a easy way to insert safely braces (`{` and `}`) in the TeX flow.

```
237 \cs_new_protected:Npn \@@_open_brace: { \lua_now:n { piton.open_brace() } }
238 \cs_new_protected:Npn \@@_close_brace: { \lua_now:n { piton.close_brace() } }
```

The following token list will be evaluated at the beginning of `\@@_begin_line:...` `\@@_end_line:` and cleared at the end. It will be used by LPEG acting between the lines of the Python code in order to add instructions to be executed at the beginning of the line.

```
239 \tl_new:N \g_@@_begin_line_hook_tl
```

For example, the LPEG Prompt will trigger the following command which will insert an instruction in the hook `\g_@@_begin_line_hook` to specify that a background must be inserted to the current line of code.

```
240 \cs_new_protected:Npn \@@_prompt:
241 {
242   \tl_gset:Nn \g_@@_begin_line_hook_tl
243   {
244     \tl_if_empty:NF \l_@@_prompt_bg_color_tl
245     { \clist_set:NV \l_@@_bg_color_clist \l_@@_prompt_bg_color_tl }
246   }
247 }
```

### 9.2.3 Treatment of a line of code

The following command is only used once.

```
248 \cs_new_protected:Npn \@@_replace_spaces:n #1
249 {
250   \tl_set:Nn \l_tmpa_tl { #1 }
251   \bool_if:NTF \l_@@_show_spaces_bool
252   {
253     \tl_set:Nn \l_@@_space_tl { }
254     \regex_replace_all:nnN { \x20 } { } \l_tmpa_tl % U+2423
255   }
256 }
```

If the key `break-lines-in-Piton` is in force, we replace all the characters U+0020 (that is to say the spaces) by `\@@_breakable_space:`. Remark that, except the spaces inserted in the LaTeX comments (and maybe in the math comments), all these spaces are of catcode “other” (=12) and are unbreakable.

```
257   \bool_if:NT \l_@@_break_lines_in_Piton_bool
258   {
259     \regex_replace_all:nnN
260     { \x20 }
261     { \c { @@_breakable_space: } }
262     \l_tmpa_tl
263   }
264 }
265 \l_tmpa_tl
266 }
```

In the contents provided by Lua, each line of the Python code will be surrounded by `\@@_begin_line:` and `\@@_end_line:`. `\@@_begin_line:` is a LaTeX command that we will define now but `\@@_end_line:` is only a syntactic marker that has no definition.

```

267 \cs_set_protected:Npn \@@_begin_line: #1 \@@_end_line:
268 {
269   \group_begin:
270   \g_@@_begin_line_hook_tl
271   \int_gzero:N \g_@@_indentation_int

```

First, we will put in the coffin `\l_tmpa_coffin` the actual content of a line of the code (without the potential number of line).

Be careful: There is curryfication in the following code.

```

272   \bool_if:NTF \l_@@_width_min_bool
273     \@@_put_in_coffin_ii:n
274     \@@_put_in_coffin_i:n
275     {
276       \language = -1
277       \raggedright
278       \strut
279       \@@_replace_spaces:n { #1 }
280       \strut \hfil
281     }

```

Now, we add the potential number of line, the potential left margin and the potential background.

```

282   \hbox_set:Nn \l_tmpa_box
283   {
284     \skip_horizontal:N \l_@@_left_margin_dim
285     \bool_if:NT \l_@@_line_numbers_bool
286     {
287       \bool_if:nF
288       {
289         \str_if_eq_p:nn { #1 } { \PitonStyle {Prompt}{ } }
290         &&
291         \l_@@_skip_empty_lines_bool
292       }
293       { \int_gincr:N \g_@@_visual_line_int }
294     }
295     \bool_if:nT
296     {
297       ! \str_if_eq_p:nn { #1 } { \PitonStyle {Prompt}{ } }
298       ||
299       ( ! \l_@@_skip_empty_lines_bool && \l_@@_label_empty_lines_bool )
300     }
301     \@@_print_number:

```

If there is a background, we must remind that there is a left margin of 0.5 em for the background...

```

302     \clist_if_empty:NF \l_@@_bg_color_clist
303     {

```

... but if only if the key `left-margin` is not used !

```

304       \dim_compare:nNnT \l_@@_left_margin_dim = \c_zero_dim
305       { \skip_horizontal:n { 0.5 em } }
306     }
307     \coffin_typeset:Nnnnn \l_tmpa_coffin T l \c_zero_dim \c_zero_dim
308   }
309   \box_set_dp:Nn \l_tmpa_box { \box_dp:N \l_tmpa_box + 1.25 pt }
310   \box_set_ht:Nn \l_tmpa_box { \box_ht:N \l_tmpa_box + 1.25 pt }
311   \clist_if_empty:NTF \l_@@_bg_color_clist
312   { \box_use_drop:N \l_tmpa_box }
313   {
314     \vtop
315     {
316       \hbox:n
317       {
318         \@@_color:N \l_@@_bg_color_clist
319         \vrule height \box_ht:N \l_tmpa_box
320         depth \box_dp:N \l_tmpa_box

```

```

321         width \l_@@_width_dim
322     }
323     \skip_vertical:n { - \box_ht_plus_dp:N \l_tmpa_box }
324     \box_use_drop:N \l_tmpa_box
325 }
326 }
327 \vspace { - 2.5 pt }
328 \group_end:
329 \tl_gclear:N \g_@@_begin_line_hook_tl
330 }

```

In the general case (which is also the simpler), the key `width` is not used, or (if used) it is not used with the special value `min`. In that case, the content of a line of code is composed in a vertical coffin with a width equal to `\l_@@_line_width_dim`. That coffin may, eventually, contain several lines when the key `broken-lines-in-Piton` (or `broken-lines`) is used.

That command takes in its argument by currying.

```

331 \cs_set_protected:Npn \@@_put_in_coffin_i:n
332 { \vcoffin_set:Nnn \l_tmpa_coffin \l_@@_line_width_dim }

```

The second case is the case when the key `width` is used with the special value `min`.

```

333 \cs_set_protected:Npn \@@_put_in_coffin_ii:n #1
334 {

```

First, we compute the natural width of the line of code because we have to compute the natural width of the whole listing (and it will be written on the aux file in the variable `\l_@@_width_dim`).

```

335     \hbox_set:Nn \l_tmpa_box { #1 }

```

Now, you can actualize the value of `\g_@@_tmp_width_dim` (it will be used to write on the aux file the natural width of the environment).

```

336     \dim_compare:nNnT { \box_wd:N \l_tmpa_box } > \g_@@_tmp_width_dim
337     { \dim_gset:Nn \g_@@_tmp_width_dim { \box_wd:N \l_tmpa_box } }
338     \hcoffin_set:Nn \l_tmpa_coffin
339     {
340         \hbox_to_wd:nn \l_@@_line_width_dim

```

We unpack the block in order to free the potential `\hfill` springs present in the LaTeX comments (cf. section 7.2, p. 19).

```

341         { \hbox_unpack:N \l_tmpa_box \hfil }
342     }
343 }

```

The command `\@@_color:N` will take in as argument a reference to a comma-separated list of colors. A color will be picked by using the value of `\g_@@_line_int` (modulo the number of colors in the list).

```

344 \cs_set_protected:Npn \@@_color:N #1
345 {
346     \int_set:Nn \l_tmpa_int { \clist_count:N #1 }
347     \int_set:Nn \l_tmpb_int { \int_mod:nn \g_@@_line_int \l_tmpa_int + 1 }
348     \tl_set:Nx \l_tmpa_tl { \clist_item:Nn #1 \l_tmpb_int }
349     \tl_if_eq:NnTF \l_tmpa_tl { none }

```

By setting `\l_@@_width_dim` to zero, the colored rectangle will be drawn with zero width and, thus, it will be a mere strut (and we need that strut).

```

350     { \dim_zero:N \l_@@_width_dim }
351     { \exp_args:NV \@@_color_i:n \l_tmpa_tl }
352 }

```

The following command `\@@_color:n` will accept both the instruction `\@@_color:n { red!15 }` and the instruction `\@@_color:n { [rgb]{0.9,0.9,0} }`.

```

353 \cs_set_protected:Npn \@@_color_i:n #1

651   \bool_set_false:N \l_@@_in_PitonOptions_bool
652 }

```

When using `\NewPitonEnvironment` a user may use `\PitonOptions` inside. However, the set of keys available should be different that in standard `\PitonOptions`. That's why we define a version of `\PitonOptions` with no restriction on the set of available keys and we will link that version to `\PitonOptions` in such environment.

```

653 \NewDocumentCommand \@@_fake_PitonOptions { }
654 { \keys_set:nn { PitonOptions } }

```

### 9.2.5 The numbers of the lines

The following counter will be used to count the lines in the code when the user requires the numbers of the lines to be printed (with `line-numbers`).

```

655 \int_new:N \g_@@_visual_line_int
656 \cs_new_protected:Npn \@@_incr_visual_line:
657 {
658   \bool_if:NF \l_@@_skip_empty_lines_bool
659   { \int_gincr:N \g_@@_visual_line_int }
660 }

661 \cs_new_protected:Npn \@@_print_number:
662 {
663   \hbox_overlap_left:n
664   {
665     {
666       \color { gray }
667       \footnotesize
668       \int_to_arabic:n \g_@@_visual_line_int
669     }
670     \skip_horizontal:N \l_@@_numbers_sep_dim
671   }
672 }

```

### 9.2.6 The command to write on the aux file

```

673 \cs_new_protected:Npn \@@_write_aux:
674 {
675   \tl_if_empty:NF \g_@@_aux_tl
676   {
677     \iow_now:Nn \@mainaux { \ExplSyntaxOn }
678     \iow_now:Nx \@mainaux
679     {
680       \tl_gset:cn { c_@@_ \int_use:N \g_@@_env_int _ tl }
681       { \exp_not:o \g_@@_aux_tl }
682     }
683     \iow_now:Nn \@mainaux { \ExplSyntaxOff }
684   }
685   \tl_gclear:N \g_@@_aux_tl
686 }

```

The following macro will be used only when the key `width` is used with the special value `min`.

```

687 \cs_new_protected:Npn \@@_width_to_aux:
688 {
689   \tl_gput_right:Nx \g_@@_aux_tl
690   {
691     \dim_set:Nn \l_@@_line_width_dim
692     { \dim_eval:n { \g_@@_tmp_width_dim } }
693   }
694 }

```

### 9.2.7 The main commands and environments for the final user

```

834                 { piton.#1(token.scan_argument()) }
835                 { #2 }
836                 \int_to_arabic:n
837                 { \g_@@_visual_line_int + \l_@@_nb_non_empty_lines_int }
838             }
839             {
840                 \int_to_arabic:n
841                 { \g_@@_visual_line_int + \l_@@_nb_lines_int }
842             }
843         }

```

```

844     \dim_set:Nn \l_@@_left_margin_dim
845     { \box_wd:N \l_tmpa_box + \l_@@_numbers_sep_dim + 0.1 em }
846   }
847 }
848 \cs_generate_variant:Nn \@@_compute_left_margin:nn { n o }

```

Whereas `\l_@@_width_dim` is the width of the environment, `\l_@@_line_width_dim` is the width of the lines of code without the potential margins for the numbers of lines and the background. Depending on the case, you have to compute `\l_@@_line_width_dim` from `\l_@@_width_dim` or we have to do the opposite.

```

849 \cs_new_protected:Npn \@@_compute_width:
850 {
851   \dim_compare:nNnTF \l_@@_line_width_dim = \c_zero_dim
852   {
853     \dim_set_eq:NN \l_@@_line_width_dim \l_@@_width_dim
854     \clist_if_empty:NTF \l_@@_bg_color_clist

```

If there is no background, we only subtract the left margin.

```

855     { \dim_sub:Nn \l_@@_line_width_dim \l_@@_left_margin_dim }

```

If there is a background, we subtract 0.5 em for the margin on the right.

```

856     {
857       \dim_sub:Nn \l_@@_line_width_dim { 0.5 em }

```

And we subtract also for the left margin. If the key `left-margin` has been used (with a numerical value or with the special value `min`), `\l_@@_left_margin_dim` has a non-zero value<sup>31</sup> and we use that value. Elsewhere, we use a value of 0.5 em.

```

858       \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
859       { \dim_sub:Nn \l_@@_line_width_dim { 0.5 em } }
860       { \dim_sub:Nn \l_@@_line_width_dim \l_@@_left_margin_dim }
861     }
862   }

```

If `\l_@@_line_width_dim` has yet a non-zero value, that means that it has been read in the aux file: it has been written by a previous run because the key `width` is used with the special value `min`). We compute now the width of the environment by computations opposite to the preceding ones.

```

863   {
864     \dim_set_eq:NN \l_@@_width_dim \l_@@_line_width_dim
865     \clist_if_empty:NTF \l_@@_bg_color_clist
866     { \dim_add:Nn \l_@@_width_dim \l_@@_left_margin_dim }
867     {
868       \dim_add:Nn \l_@@_width_dim { 0.5 em }
869       \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
870       { \dim_add:Nn \l_@@_width_dim { 0.5 em } }
871       { \dim_add:Nn \l_@@_width_dim \l_@@_left_margin_dim }
872     }
873   }
874 }

```

```

875 \NewDocumentCommand { \NewPitonEnvironment } { m m m m }
876 {

```

We construct a TeX macro which will catch as argument all the tokens until `\end{name_env}` with, in that `\end{name_env}`, the catcodes of `\`, `{` and `}` equal to 12 (“other”). The latter explains why the definition of that function is a bit complicated.

```

877   \use:x

```

We count with Lua the number of lines of the argument. The result will be stored by Lua in `\l_@@_nb_lines_int`. That information will be used to allow or disallow page breaks. The use of `token.scan_argument` avoids problems with the delimiters of the Lua string.

```

887         \lua_now:n { piton.CountLines(token.scan_argument()) } { ##1 }

```

The first argument of the following function is the name of the Lua function that will be applied to the second argument in order to count the number of lines.

```

888         @@_compute_left_margin:nn { CountNonEmptyLines } { ##1 }
889         @@_compute_width:
890         \ttfamily
891         \dim_zero:N \parskip

```

Now, the key `write`.

```

892         \str_if_empty:NTF \l_@@_path_write_str
893         { \lua_now:e { piton.write = "\l_@@_write_str" } }
894         {
895             \lua_now:e
896             { piton.write = "\l_@@_path_write_str / \l_@@_write_str" }
897         }
898         \str_if_empty:NTF \l_@@_write_str
899         { \lua_now:n { piton.write = '' } }
900         {
901             \seq_if_in:NVTF \g_@@_write_seq \l_@@_write_str
902             { \lua_now:n { piton.write_mode = "a" } }
903             {
904                 \lua_now:n { piton.write_mode = "w" }
905                 \seq_gput_left:NV \g_@@_write_seq \l_@@_write_str
906             }
907         }

```

Now, the main job.

```

908         \bool_if:NTF \l_@@_split_on_empty_lines_bool
909         \@@_gobble_split_parse:n
910         \@@_gobble_parse:n
911         { ##1 }

```

If the user has used the key `width` with the special value `min`, we write on the aux file the value of `\l_@@_line_width_dim` (largest width of the lines of code of the environment).

```

912         \bool_if:NT \l_@@_width_min_bool \@@_width_to_aux:

```

The following `\end{##1}` is only for the stack of environments of LaTeX.

```

913         \end { ##1 }
914         \@@_write_aux:
915     }

```

We can now define the new environment.

We are still in the definition of the command `\NewPitonEnvironment...`

```

916     \NewDocumentEnvironment { #1 } { #2 }
917     {
918         \cs_set_eq:NN \PitonOptions \@@_fake_PitonOptions
919         #3
920         \@@_pre_env:
921         \int_compare:nNnT \l_@@_number_lines_start_int > \c_zero_int
922         { \int_gset:Nn \g_@@_visual_line_int { \l_@@_number_lines_start_int - 1 } }
923         \group_begin:
924         \tl_map_function:nN
925         { \ \ \ { \ } \$ \& \# \^ \_ \% \~ \^^I }
926         \char_set_catcode_other:N
927         \use:c { _@@_collect_ #1 :w }
928     }
929     { #4 }

```

The following code is for technical reasons. We want to change the catcode of `^^M` before catching the arguments of the new environment we are defining. Indeed, if not, we will have problems if there is a final optional argument in our environment (if that final argument is not used by the user in an instance of the environment, a spurious space is inserted, probably because the `^^M` is converted to space).

```

930   \AddToHook { env / #1 / begin } { \char_set_catcode_other:N ^^M }
931 }

```

This is the end of the definition of the command `\NewPitonEnvironment`.

The following function will be used when the key `split-on-empty-lines` is not in force. It will gobble the spaces at the beginning of the lines and parse the code. The argument is provided by curryfication.

```

932 \cs_new_protected:Npn \@@_gobble_parse:n
933 {
934   \lua_now:e
935   {
936     piton.GobbleParse
937     (
938       '\l_piton_language_str' ,
939       \int_use:N \l_@@_gobble_int ,
940       token.scan_argument ( )
941     )
942   }
943 }

```

The following function will be used when the key `split-on-empty-lines` is in force. It will gobble the spaces at the beginning of the lines (if the key `gobble` is in force), then split the code at the empty lines and, eventually, parse the code. The argument is provided by curryfication.

```

944 \cs_new_protected:Npn \@@_gobble_split_parse:n
945 {
946   \lua_now:e
947   {
948     piton.GobbleSplitParse
949     (
950       '\l_piton_language_str' ,
951       \int_use:N \l_@@_gobble_int ,
952       token.scan_argument ( )
953     )
954   }
955 }

```

Now, we define the environment `{Piton}`, which is the main environment provided by the package `piton`. Of course, you use `\NewPitonEnvironment`.

```

956 \bool_if:NTF \g_@@_beamer_bool
957 {
958   \NewPitonEnvironment { Piton } { d < > 0 { } }
959   {
960     \keys_set:nn { PitonOptions } { #2 }
961     \tl_if_novalue:nTF { #1 }
962     { \begin { uncoverenv } }
963     { \begin { uncoverenv } < #1 > }
964   }
965   { \end { uncoverenv } }
966 }
967 {
968   \NewPitonEnvironment { Piton } { 0 { } }
969   { \keys_set:nn { PitonOptions } { #1 } }
970   { }
971 }

```

The code of the command `\PitonInputFile` is somewhat similar to the code of the environment `{Piton}`. In fact, it's simpler because there isn't the problem of catching the content of the environment in a verbatim mode.

```

972 \NewDocumentCommand { \PitonInputFile } { d < > 0 { } m }
973 {
974   \group_begin:
975   \tl_if_empty:NTF \l_@@_path_str
976     { \str_set:Nn \l_@@_file_name_str { #3 } }
977     {
978       \str_set_eq:NN \l_@@_file_name_str \l_@@_path_str
979       \str_put_right:Nn \l_@@_file_name_str { / #3 }
980     }
981   \file_if_exist:nTF { \l_@@_file_name_str }
982     { \@@_input_file:nn { #1 } { #2 } }
983     { \msg_error:nnn { piton } { Unknown-file } { #3 } }
984   \group_end:
985 }

```

The following command uses as implicit argument the name of the file in `\l_@@_file_name_str`.

```

986 \cs_new_protected:Npn \@@_input_file:nn #1 #2
987 {

```

We recall that, if we are in Beamer, the command `\PitonInputFile` is “overlay-aware” and that’s why there is an optional argument between angular brackets (`<` and `>`).

```

988   \tl_if_novalue:nF { #1 }
989   {

1163     \sort_return_same:
1164     \sort_return_swapped:
1165 }

```

## 9.2.9 The initial styles

The initial styles are inspired by the style “manni” of Pygments.

```

1166 \SetPitonStyle
1167 {
1168   Comment          = \color[HTML]{0099FF} \itshape ,
1169   Exception        = \color[HTML]{CC0000} ,
1170   Keyword          = \color[HTML]{006699} \bfseries ,
1171   Keyword.Constant = \color[HTML]{006699} \bfseries ,
1172   Name.Builtin     = \color[HTML]{336666} ,
1173   Name.Decorator   = \color[HTML]{9999FF},
1174   Name.Class       = \color[HTML]{00AA88} \bfseries ,
1175   Name.Function    = \color[HTML]{CC00FF} ,
1176   Name.Namespace   = \color[HTML]{00CCFF} ,
1177   Name.Constructor = \color[HTML]{006000} \bfseries ,
1178   Name.Field       = \color[HTML]{AA6600} ,
1179   Name.Module      = \color[HTML]{0060A0} \bfseries ,

```

```

1180 Name.Table      = \color[HTML]{309030} ,
1181 Number         = \color[HTML]{FF6600} ,
1182 Operator       = \color[HTML]{555555} ,
1183 Operator.Word  = \bfseries ,
1184 String         = \color[HTML]{CC3300} ,
1185 String.Doc     = \color[HTML]{CC3300} \itshape ,
1186 String.Interpol = \color[HTML]{AA0000} ,
1187 Comment.LaTeX  = \normalfont \color[rgb]{.468,.532,.6} ,
1188 Name.Type      = \color[HTML]{336666} ,
1189 InitialValues = \@_piton:n ,
1190 Interpol.Inside = \color{black}\@_piton:n ,
1191 TypeParameter = \color[HTML]{336666} \itshape ,
1192 Preproc       = \color[HTML]{AA6600} \slshape ,
1193 Identifier     = \@_identifier:n ,
1194 directive     = \color[HTML]{AA6600} ,
1195 UserFunction  = ,
1196 Prompt       = ,
1197 ParseAgain.noCR = \@_piton_no_cr:n ,
1198 ParseAgain    = \@_piton:n ,
1199 Discard      = \use_none:n
1200 }

```

The last styles `ParseAgain.noCR` and `ParseAgain` should be considered as “internal style” (not available for the final user). However, maybe we will change that and document these styles for the final user (why not?).

If the key `math-comments` has been used at load-time, we change the style `Comment.Math` which should be considered only at an “internal style”. However, maybe we will document in a future version the possibility to write change the style *locally* in a document).

```

1201 \AtBeginDocument
1202 {
1203   \bool_if:NT \g_@@_math_comments_bool
1204     { \SetPitonStyle { Comment.Math = \@_math_scantokens:n } }
1205 }

```

### 9.2.10 Highlighting some identifiers

```

1206 \NewDocumentCommand { \SetPitonIdentifier } { o m m }
1207 {
1208   \clist_set:Nn \l_tmpa_clist { #2 }
1209   \tl_if_novalue:nTF { #1 }
1210     {
1211       \clist_map_inline:Nn \l_tmpa_clist
1212         { \cs_set:cpn { PitonIdentifier _ ##1 } { #3 } }
1213     }
1214     {
1215       \str_set:Nx \l_tmpa_str { \str_lowercase:n { #1 } }
1216       \str_if_eq:onT \l_tmpa_str { current-language }
1217         { \str_set_eq:NN \l_tmpa_str \l_piton_language_str }
1218       \clist_map_inline:Nn \l_tmpa_clist
1219         { \cs_set:cpn { PitonIdentifier _ \l_tmpa_str _ ##1 } { #3 } }
1220     }
1221 }
1222 \cs_new_protected:Npn \@_identifier:n #1
1223 {
1224   \cs_if_exist_use:cF { PitonIdentifier _ \l_piton_language_str _ #1 }
1225     { \cs_if_exist_use:c { PitonIdentifier _ #1 } }
1226   { #1 }
1227 }

```

In particular, we have an highlighting of the indentifiers which are the names of Python functions previously defined by the user. Indeed, when a Python function is defined, the style `Name.Function.Internal` is applied to that name. We define now that style (you define it directly and you short-cut the function `\SetPitonStyle`).

```
1228 \cs_new_protected:cpn { pitonStyle _ Name.Function.Internal } #1
1229 {
```

First, the element is composed in the TeX flow with the style `Name.Function` which is provided to the final user.

```
1230   { \PitonStyle { Name.Function } { #1 } }
```

Now, we specify that the name of the new Python function is a known identifier that will be formatted with the Piton style `UserFunction`. Of course, here the affectation is global because we have to exit many groups and even the environments `{Piton}`.

```
1231   \cs_gset_protected:cpn { PitonIdentifier _ \l_piton_language_str _ #1 }
1232   { \PitonStyle { UserFunction } }
```

Now, we put the name of that new user function in the dedicated sequence (specific of the current language). **That sequence will be used only by `\PitonClearUserFunctions`.**

```
1233   \seq_if_exist:cF { g_@@_functions _ \l_piton_language_str _ seq }
1234   { \seq_new:c { g_@@_functions _ \l_piton_language_str _ seq } }
1235   \seq_gput_right:cn { g_@@_functions _ \l_piton_language_str _ seq } { #1 }
```

We update `g_@@_languages_seq` which is used only by the command `\PitonClearUserFunctions` when it's used without its optional argument.

```
1236   \seq_if_in:NVF \g_@@_languages_seq \l_piton_language_str
1237   { \seq_gput_left:NV \g_@@_languages_seq \l_piton_language_str }
1238   }
```

```
1239 \NewDocumentCommand \PitonClearUserFunctions { ! o }
1240 {
1241   \tl_if_novalue:nTF { #1 }
```

If the command is used without its optional argument, we will deleted the user language for all the informatic languages.

```
1242   { \@@_clear_all_functions: }
1243   { \@@_clear_list_functions:n { #1 } }
1244   }
```

```
1245 \cs_new_protected:Npn \@@_clear_list_functions:n #1
1246 {
1247   \clist_set:Nn \l_tmpa_clist { #1 }
1248   \clist_map_function:NN \l_tmpa_clist \@@_clear_functions_i:n
1249   \clist_map_inline:nn { #1 }
1250   { \seq_gremove_all:Nn \g_@@_languages_seq { ##1 } }
1251   }
```

```
1252 \cs_new_protected:Npn \@@_clear_functions_i:n #1
1253 { \exp_args:Ne \@@_clear_functions_ii:n { \str_lowercase:n { #1 } } }
```

The following command clears the list of the user-defined functions for the language provided in argument (mandatory in lower case).

```
1254 \cs_new_protected:Npn \@@_clear_functions_ii:n #1
1255 {
1256   \seq_if_exist:cT { g_@@_functions _ #1 _ seq }
1257   {
1258     \seq_map_inline:cn { g_@@_functions _ #1 _ seq }
1259     { \cs_undefine:c { PitonIdentifier _ #1 _ ##1 } }
1260     \seq_gclear:c { g_@@_functions _ #1 _ seq }
1261   }
1262   }
```

```
1263 \cs_new_protected:Npn \@@_clear_functions:n #1
1264 {
1265   \@@_clear_functions_i:n { #1 }
```

```

1266 \seq_gremove_all:Nn \g_@@_languages_seq { #1 }
1267 }

```

The following command clears all the user-defined functions for all the informatic languages.

```

1268 \cs_new_protected:Npn \@@_clear_all_functions:
1269 {
1270   \seq_map_function:NN \g_@@_languages_seq \@@_clear_functions_i:n
1271   \seq_gclear:N \g_@@_languages_seq
1272 }

```

### 9.2.11 Security

1445     }
1446   function piton.addListCommands( key_value )
1447     piton.ListCommands = piton.ListCommands + my_lpeg : match ( key_value )
1448   end
1449 \end{luacode*}
1450 \</STY>

```

### 9.3 The Lua part of the implementation

The Lua code will be loaded via a `{luacode*}` environment. The environment is by itself a Lua block and the local declarations will be local to that block. All the global functions (used by the L3 parts of the implementation) will be put in a Lua table `piton`.

```

1451 \*LUA>
1452 if piton.comment_latex == nil then piton.comment_latex = ">" end
1453 piton.comment_latex = "#" .. piton.comment_latex

```

The following functions are an easy way to safely insert braces (`{` and `}`) in the TeX flow.

```

1454 function piton.open_brace ()
1455   tex.sprint("{")
1456 end
1457 function piton.close_brace ()
1458   tex.sprint("}")
1459 end
1460 local function sprintL3 ( s )
1461   tex.sprint ( luatexbase.catcodetables.expl , s )
1462 end
1463 % \end{uncoverenv}
1464 %
1465 % \bigskip
1466 % \subsubsection{Special functions dealing with LPEG}
1467 %
1468 % \medskip
1469 % We will use the Lua library \pkg{lpeg} which is built in LuaTeX. That's why we
1470 % define first aliases for several functions of that library.
1471 % \begin{macrocode}
1472 local P, S, V, C, Ct, Cc = lpeg.P, lpeg.S, lpeg.V, lpeg.C, lpeg.Ct, lpeg.Cc
1473 local Cs , Cg , Cmt , Cb = lpeg.Cs, lpeg.Cg , lpeg.Cmt , lpeg.Cb
1474 local R = lpeg.R

```

The function `Q` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with the catcode “other” for all the characters: it’s suitable for elements of the Python listings that `piton` will typeset verbatim (thanks to the catcode “other”).

```

1475 local function Q ( pattern )
1476   return Ct ( Cc ( luatexbase.catcodetables.CatcodeTableOther ) * C ( pattern ) )
1477 end

```

The function `L` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with standard LaTeX catcodes for all the characters: the elements captured will be formatted as normal LaTeX codes. It's suitable for the "LaTeX comments" in the environments `{Piton}` and the elements between `begin-escape` and `end-escape`. That function won't be much used.

```
1478 local function L ( pattern )
1479   return Ct ( C ( pattern ) )
1480 end
```

The function `Lc` (the *c* is for *constant*) takes in as argument a string and returns a LPEG *with does a constant capture* which returns that string. The elements captured will be formatted as L3 code. It will be used to send to LaTeX all the formatting LaTeX instructions we have to insert in order to do the syntactic highlighting (that's the main job of `piton`). That function, unlike the previous one, will be widely used.

```
1481 local function Lc ( string )
1482   return Cc ( { luatexbase.catcodetables.expl , string } )
1483 end
```

The function `K` creates a LPEG which will return as capture the whole LaTeX code corresponding to a Python chunk (that is to say with the LaTeX formatting instructions corresponding to the syntactic nature of that Python chunk). The first argument is a Lua string corresponding to the name of a `piton` style and the second element is a pattern (that is to say a LPEG without capture)

```
1484 e
1485 local function K ( style , pattern )
1486   return
1487     Lc ( "{\\PitonStyle{" .. style .. "}{" )
1488     * Q ( pattern )
1489     * Lc "}"
1490 end
```

The formatting commands in a given `piton` style (eg. the style `Keyword`) may be semi-global declarations (such as `\bfseries` or `\slshape`) or LaTeX macros with an argument (such as `\fbox` or `\colorbox{yellow}`). In order to deal with both syntaxes, we have used two pairs of braces: `{\\PitonStyle{Keyword}{text to format}}`.

The following function `WithStyle` is similar to the function `K` but should be used for multi-lines elements.

```
1491 local function WithStyle ( style , pattern )
1492   return
1493     Ct ( Cc "Open" * Cc ( "{\\PitonStyle{" .. style .. "}{" ) * Cc "}" )
1494     * pattern
1495     * Ct ( Cc "Close" )
1496 end
```

The following LPEG catches the Python chunks which are in LaTeX escapes (and that chunks will be considered as normal LaTeX constructions).

```
1497 Escape = P ( false )
1498 EscapeClean = P ( false )
1499 if piton.begin_escape ~= nil
1500 then
1501   Escape =
1502     P ( piton.begin_escape )
1503     * L ( ( 1 - P ( piton.end_escape ) ) ^ 1 )
1504     * P ( piton.end_escape )
```

The LPEG `EscapeClean` will be used in the LPEG `Clean` (and that LPEG is used to "clean" the code by removing the formatting elements).

```
1505 EscapeClean =
1506   P ( piton.begin_escape )
1507   * ( 1 - P ( piton.end_escape ) ) ^ 1
1508   * P ( piton.end_escape )
1509 end
```

```

1510 EscapeMath = P ( false )
1511 if piton.begin_escape_math ~= nil
1512 then
1513     EscapeMath =
1514         P ( piton.begin_escape_math )
1515         * Lc "\\ensuremath{"
1516         * L ( ( 1 - P(piton.end_escape_math) ) ^ 1 )
1517         * Lc ( "}" )
1518         * P ( piton.end_escape_math )
1519 end

```

The following line is mandatory.

```

1520 lpeg.locale(lpeg)

```

### The basic syntactic LPEG

```

1521 local alpha , digit = lpeg.alpha , lpeg.digit
1522 local space = P " "

```

Remember that, for LPEG, the Unicode characters such as  $\grave{a}$ ,  $\hat{a}$ ,  $\zeta$ , etc. are in fact strings of length 2 (2 bytes) because lpeg is not Unicode-aware.

```

1523 local letter = alpha + "_" + "\u00c0" + "\u00c1" + "\u00c2" + "\u00c3" + "\u00c4" + "\u00c5" + "\u00c6" + "\u00c7" + "\u00c8" + "\u00c9" + "\u00ca" + "\u00cb"
1524                 + "\u00cc" + "\u00cd" + "\u00ce" + "\u00cf" + "\u00d0" + "\u00d1" + "\u00d2" + "\u00d3" + "\u00d4" + "\u00d5" + "\u00d6" + "\u00d7" + "\u00d8" + "\u00d9"
1525                 + "\u00da" + "\u00db" + "\u00dc" + "\u00dd" + "\u00de" + "\u00df"
1526
1527 local alphanum = letter + digit

```

The following LPEG `identifier` is a mere pattern (that is to say more or less a regular expression) which matches the Python identifiers (hence the name).

```

1528 local identifier = letter * alphanum ^ 0

```

On the other hand, the LPEG `Identifier` (with a capital) also returns a *capture*.

```

1529 local Identifier = K ( 'Identifier' , identifier )

```

By convention, we will use names with an initial capital for LPEG which return captures.

Here is the first use of our function `K`. That function will be used to construct LPEG which capture Python chunks for which we have a dedicated `piton` style. For example, for the numbers, `piton` provides a style which is called `Number`. The name of the style is provided as a Lua string in the second argument of the function `K`. By convention, we use single quotes for delimiting the Lua strings which are names of `piton` styles (but this is only a convention).

```

1530 local Number =
1531     K ( 'Number' ,
1532         ( digit ^ 1 * P "." * # ( 1 - P "." ) * digit ^ 0
1533           + digit ^ 0 * P "." * digit ^ 1
1534           + digit ^ 1 )
1535         * ( S "eE" * S "+-" ^ -1 * digit ^ 1 ) ^ -1
1536         + digit ^ 1
1537     )

```

We recall that `piton.begin_escape` and `piton_end_escape` are Lua strings corresponding to the keys `begin-escape` and `end-escape`.

```

1538 local Word
1539 if piton.begin_escape then
1540     Word = Q ( ( 1 - space - piton.begin_escape - piton.end_escape
1541               - S "\\r[{}]" - digit ) ^ 1 )
1542 else
1543     Word = Q ( ( 1 - space - S "\\r[{}]" - digit ) ^ 1 )
1544 end

```

```

1545 local Space = Q " " ^ 1
1546
1547 local SkipSpace = Q " " ^ 0
1548
1549 local Punct = Q ( S ".,;!" )
1550
1551 local Tab = "\t" * Lc "\\l_@@_tab_t1"

1552 local SpaceIndentation = Lc "\\@@_an_indentation_space:" * Q " "

1553 local Delim = Q ( S "[({})]" )

```

The following LPEG catches a space (U+0020) and replace it by `\l_@@_space_t1`. It will be used in the strings. Usually, `\l_@@_space_t1` will contain a space and therefore there won't be difference. However, when the key `show-spaces-in-strings` is in force, `\l_@@_space_t1` will contain `□` (U+2423) in order to visualize the spaces.

```

1554 local VisualSpace = space * Lc "\\l_@@_space_t1"

```

### Several tools for the construction of the main LPEG

```

1555 local LPEG0 = { }
1556 local LPEG1 = { }
1557 local LPEG2 = { }
1558 local LPEG_cleaner = { }

```

For each language, we will need a pattern to match expressions with balanced braces. Those balanced braces must *not* take into account the braces present in strings of the language. However, the syntax for the strings is language-dependent. That's why we write a Lua function `Compute_braces` which will compute the pattern by taking in as argument a pattern for the strings of the language (at least the shorts strings).

```

1559 local function Compute_braces ( lpeg_string ) return
1560     P { "E" ,
1561         E =
1562             (
1563                 "{" * V "E" * "}"
1564                 +
1565                 lpeg_string
1566                 +
1567                 ( 1 - S "{" )
1568             ) ^ 0
1569     }
1570 end

```

The following Lua function will compute the `lpeg DetectedCommands` which is a LPEG with captures).

```

1571 local function Compute_DetectedCommands ( lang , braces ) return
1572     Ct ( Cc "Open"
1573         * C ( piton.ListCommands * P "{" )
1574         * Cc "}"
1575     )
1576     * ( braces / (function ( s ) return LPEG1[lang] : match ( s ) end ) )
1577     * P "}"
1578     * Ct ( Cc "Close" )
1579 end

```

```

1580 local function Compute_LPEG_cleaner ( lang , braces ) return
1581   Ct ( ( piton.ListCommands * "{"
1582         * ( braces
1583             / ( function ( s ) return LPEG_cleaner[lang] : match ( s ) end ) )
1584         * "}"
1585         + EscapeClean
1586         + C ( P ( 1 ) )
1587         ) ^ 0 ) / table.concat
1588 end

```

**Constructions for Beamer** If the class Beamer is used, some environemnts and commands of Beamer are automatically detected in the listings of piton.

```

1589 local Beamer = P ( false )
1590 local BeamerBeginEnvironments = P ( true )
1591 local BeamerEndEnvironments = P ( true )

1592 local list_beamer_env =
1593   { "uncoverenv" , "onlyenv" , "visibleenv" ,
1594     "invisibleenv" , "alertenv" , "actionenv" }

1595 local BeamerNamesEnvironments = P ( false )
1596 for _ , x in ipairs ( list_beamer_env ) do
1597   BeamerNamesEnvironments = BeamerNamesEnvironments + x
1598 end

1599 BeamerBeginEnvironments =
1600   ( space ^ 0 *
1601     L
1602       (
1603         P "\\begin{" * BeamerNamesEnvironments * "}"
1604         * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1605       )
1606       * "\r"
1607     ) ^ 0

1608 BeamerEndEnvironments =
1609   ( space ^ 0 *
1610     L ( P "\\end{" * BeamerNamesEnvironments * "}" )
1611       * "\r"
1612     ) ^ 0

```

The following Lua function will be used to compute the LPEG Beamer for each informatic language.

```

1613 local function Compute_Beamer ( lang , braces )

```

We will compute in lpeg the LPEG that we will return.

```

1614 local lpeg = L ( P "\\pause" * ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1 )
1615 lpeg = lpeg +
1616   Ct ( Cc "Open"
1617         * C ( ( P "\\uncover" + "\\only" + "\\alert" + "\\visible"
1618               + "\\invisible" + "\\action" )
1619             * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1620             * P "{"
1621           )
1622         * Cc "}"
1623       )
1624     * ( braces / ( function ( s ) return LPEG1[lang] : match ( s ) end ) )
1625     * "}"
1626     * Ct ( Cc "Close" )

```

For the command `\alt`, the specification of the overlays (between angular brackets) is mandatory.

```

1627 lpeg = lpeg +
1628   L ( P "\\alt" * "<" * ( 1 - P ">" ) ^ 0 * ">" * "{" )
1629     * K ( 'ParseAgain.noCR' , braces )
1630     * L ( P "}" )
1631     * K ( 'ParseAgain.noCR' , braces )
1632     * L ( P "]" )

```

For `\temporal`, the specification of the overlays (between angular brackets) is mandatory.

```

1633 lpeg = lpeg +
1634   L ( ( P "\\temporal" ) * "<" * ( 1 - P ">" ) ^ 0 * ">" * "{" )
1635     * K ( 'ParseAgain.noCR' , braces )
1636     * L ( P "}" )
1637     * K ( 'ParseAgain.noCR' , braces )
1638     * L ( P "}" )
1639     * K ( 'ParseAgain.noCR' , braces )
1640     * L ( P "]" )

```

Now, the environments of Beamer.

```

1641 for _ , x in ipairs ( list_beamer_env ) do
1642   lpeg = lpeg +
1643     Ct ( Cc "Open"
1644         * C (
1645             P ( "\\begin{" .. x .. "}" )
1646             * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
1647           )
1648         * Cc ( "\\end{" .. x .. "}" )
1649       )
1650     * (
1651       ( ( 1 - P ( "\\end{" .. x .. "}" ) ) ^ 0 )
1652       / ( function ( s ) return LPEG1[lang] : match ( s ) end )
1653     )
1654     * P ( "\\end{" .. x .. "}" )
1655     * Ct ( Cc "Close" )
1656   end

```

Now, you can return the value we have computed.

```

1657   return lpeg
1658 end

```

The following LPEG is in relation with the key `math-comments`. It will be used in all the languages.

```

1659 local CommentMath =
1660   P "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * P "$" -- $

```

**EOL** The following LPEG will detect the Python prompts when the user is typesetting an interactive session of Python (directly or through `{pyconsole}` of `pyluatex`). We have to detect that prompt twice. The first detection (called *hasty detection*) will be before the `\@@_begin_line:` because you want to trigger a special background color for that row (and, after the `\@@_begin_line:`, it's too late to change de background).

```

1661 local PromptHastyDetection =
1662   ( # ( P ">>>" + "...") * Lc '\\@@_prompt:' ) ^ -1

```

We remind that the marker `#` of LPEG specifies that the pattern will be detected but won't consume any character.

With the following LPEG, a style will actually be applied to the prompt (for instance, it's possible to decide to discard these prompts).

```

1663 local Prompt = K ( 'Prompt' , ( ( P ">>>" + "...") * P " " ^ -1 ) ^ -1 )

```

The following LPEG EOL is for the end of lines.

```

1664 local EOL =
1665   P "\r"
1666   *
1667   (
1668     ( space ^ 0 * -1 )
1669     +

```

We recall that each line in the Python code we have to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`<sup>32</sup>.

```

1670   Ct (
1671     Cc "EOL"
1672     *
1673     Ct (
1674       Lc "\\@@_end_line:"
1675       * BeamerEndEnvironments
1676       * BeamerBeginEnvironments
1677       * PromptHastyDetection
1678       * Lc "\\@@_newline: \\@@_begin_line:"
1679       * Prompt
1680     )
1681   )
1682 )
1683 * ( SpaceIndentation ^ 0 * # ( 1 - S "\r" ) ) ^ -1

```

The following LPEG `CommentLaTeX` is for what is called in that document the “LaTeX comments”. Since the elements that will be caught must be sent to LaTeX with standard LaTeX catcodes, we put the capture (done by the function `C`) in a table (by using `Ct`, which is an alias for `lpeg.Ct`).

```

1684 local CommentLaTeX =
1685   P(piton.comment_latex)
1686   * Lc "{\\PitonStyle{Comment.LaTeX}{\\ignorespaces}"
1687   * L ( ( 1 - P "\r" ) ^ 0 )
1688   * Lc "}"
1689   * ( EOL + -1 )

```

### 9.3.1 The language Python

Some strings of length 2 are explicit because we want the corresponding ligatures available in some fonts such as *Fira Code* to be active.

```

1690 local Operator =
1691   K ( 'Operator' ,
1692     P "!=" + "<>" + "==" + "<<" + ">>" + "<=" + ">=" + ":@" + "://" + "**"
1693     + S "--+/*%=<>&.@|" )
1694
1695 local OperatorWord =
1696   K ( 'Operator.Word' , P "in" + "is" + "and" + "or" + "not" )
1697
1698 local Keyword =
1699   K ( 'Keyword' ,
1700     P "as" + "assert" + "break" + "case" + "class" + "continue" + "def" +
1701     "del" + "elif" + "else" + "except" + "exec" + "finally" + "for" + "from" +
1702     "global" + "if" + "import" + "lambda" + "non local" + "pass" + "return" +
1703     "try" + "while" + "with" + "yield" + "yield from" )
1704   + K ( 'Keyword.Constant' , P "True" + "False" + "None" )
1705
1706 local Builtin =

```

---

<sup>32</sup>Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

1707 K ( 'Name.Builtin' ,
1708 P "__import__" + "abs" + "all" + "any" + "bin" + "bool" + "bytearray" +

1737 "ConnectionRefusedError" + "ConnectionResetError" + "FileExistsError" +
1738 "FileNotFoundError" + "InterruptedError" + "IsADirectoryError" +
1739 "NotADirectoryError" + "PermissionError" + "ProcessLookupError" +
1740 "TimeoutError" + "StopAsyncIteration" + "ModuleNotFoundError" +
1741 "RecursionError" )
1742
1743
1744 local RaiseException = K ( 'Keyword' , P "raise" ) * SkipSpace * Exception * Q "("
1745

```

In Python, a “decorator” is a statement whose begins by @ which patches the function defined in the following statement.

```

1746 local Decorator = K ( 'Name.Decorator' , P "@" * letter ^ 1 )

```

The following LPEG DefClass will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style Name.Class).

Example: `class myclass:`

```

1747 local DefClass =
1748 K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )

```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG Keyword (useful if we want to type a list of keywords).

The following LPEG ImportAs is used for the lines beginning by `import`. We have to detect the potential keyword `as` because both the name of the module and its alias must be formatted with the piton style `Name.Namespace`.

Example: `import numpy as np`

Moreover, after the keyword `import`, it’s possible to have a comma-separated list of modules (if the keyword `as` is not used).

Example: `import math, numpy`

```

1749 local ImportAs =

```

```

1750 K ( 'Keyword' , "import" )
1751 * Space
1752 * K ( 'Name.Namespace' , identifier * ( "." * identifier ) ^ 0 )
1753 * (
1754   ( Space * K ( 'Keyword' , "as" ) * Space
1755     * K ( 'Name.Namespace' , identifier ) )
1756   +
1757   ( SkipSpace * Q "," * SkipSpace
1758     * K ( 'Name.Namespace' , identifier ) ) ^ 0
1759 )

```

Be careful: there is no commutativity of + in the previous expression.

The LPEG `FromImport` is used for the lines beginning by `from`. We need a special treatment because the identifier following the keyword `from` must be formatted with the `piton` style `Name.Namespace` and the following keyword `import` must be formatted with the `piton` style `Keyword` and must *not* be caught by the LPEG `ImportAs`.

Example: `from math import pi`

```

1760 local FromImport =
1761   K ( 'Keyword' , "from" )
1762   * Space * K ( 'Name.Namespace' , identifier )
1763   * Space * K ( 'Keyword' , "import" )

```

**The strings of Python** For the strings in Python, there are four categories of delimiters (without counting the prefixes for f-strings and raw strings). We will use, in the names of our LPEG, prefixes to distinguish the LPEG dealing with that categories of strings, as presented in the following tabular.

	Single	Double
Short	'text'	"text"
Long	'''test'''	"""text"""

We have also to deal with the interpolations in the f-strings. Here is an example of a f-string with an interpolation and a format instruction<sup>33</sup> in that interpolation:

```
f'Total price: {total+1:.2f} €'
```

The interpolations beginning by % (even though there is more modern technics now in Python).

```

1764 local PercentInterpol =
1765   K ( 'String.Interpol' ,
1766     P "%"
1767     * ( "(" * alphanum ^ 1 * ")" ) ^ -1
1768     * ( S "-#0 +" ) ^ 0
1769     * ( digit ^ 1 + "*" ) ^ -1
1770     * ( "." * ( digit ^ 1 + "*" ) ) ^ -1
1771     * ( S "HLL" ) ^ -1
1772     * S "sdfFeExXorgiGauc%"
1773   )

```

We can now define the LPEG for the four kinds of strings. It's not possible to use our function `K` because of the interpolations which must be formatted with another `piton` style that the rest of the string.<sup>34</sup>

```

1774 local SingleShortString =
1775   WithStyle ( 'String.Short' ,

```

<sup>33</sup>There is no special `piton` style for the formatting instruction (after the colon): the style which will be applied will be the style of the encompassing string, that is to say `String.Short` or `String.Long`.

<sup>34</sup>The interpolations are formatted with the `piton` style `Interpol. Inside`. The initial value of that style is `\@@_piton:n` wich means that the interpolations are parsed once again by `piton`.

First, we deal with the f-strings of Python, which are prefixed by f or F.

```

1776     Q ( P "f" + "F" )
1777     * (
1778         K ( 'String.Interpol' , "{" )
1779         * K ( 'Interpol.Inside' , ( 1 - S "}':" ) ^ 0 )
1780         * Q ( P ":" * ( 1 - S "}':" ) ^ 0 ) ^ -1
1781         * K ( 'String.Interpol' , "}" )
1782         +
1783         VisualSpace
1784         +
1785         Q ( ( P "\\'" + "{{" + "}}" + 1 - S " {}'" ) ^ 1 )
1786     ) ^ 0
1787     * Q ""
1788     +

```

Now, we deal with the standard strings of Python, but also the “raw strings”.

```

1789     Q ( P "" + "r" + "R" )
1790     * ( Q ( ( P "\\'" + 1 - S " '\r%" ) ^ 1 )
1791         + VisualSpace
1792         + PercentInterpol
1793         + Q "%"
1794     ) ^ 0
1795     * Q "" )
1796
1797 local DoubleShortString =
1798     WithStyle ( 'String.Short' ,
1799         Q ( P "f\" + "F\" )
1800         * (
1801             K ( 'String.Interpol' , "{" )
1802             * K ( 'Interpol.Inside' , ( 1 - S "}\" )" ) ^ 0 )
1803             * ( K ( 'String.Interpol' , ":" ) * Q ( ( 1 - S "}:\\" )" ) ^ 0 ) ) ^ -1
1804             * K ( 'String.Interpol' , "}" )
1805             +
1806             VisualSpace
1807             +
1808             Q ( ( P "\\\" + "{{" + "}}" + 1 - S " {}\" )" ) ^ 1 )
1809         ) ^ 0
1810     * Q "\"
1811     +
1812     Q ( P "\" + "r\" + "R\" )
1813     * ( Q ( ( P "\\\" + 1 - S " \"\r%" ) ^ 1 )
1814         + VisualSpace
1815         + PercentInterpol
1816         + Q "%"
1817     ) ^ 0
1818     * Q "\" )
1819
1820 local ShortString = SingleShortString + DoubleShortString

```

## Beamer

```

1821 local braces = Compute_braces ( ShortString )
1822 if piton.beamer then Beamer = Compute_Beamer ( 'python' , braces ) end

```

## Detected commands

```

1823 DetectedCommands = Compute_DetectedCommands ( 'python' , braces )

```

## LPEG\_cleaner

```

1824 LPEG_cleaner['python'] = Compute_LPEG_cleaner ( 'python' , braces )

```

## The long strings

```

1825 local SingleLongString =
1826   WithStyle ( 'String.Long' ,
1827     ( Q ( S "fF" * P "'''' " )
1828       * (
1829         K ( 'String.Interpol' , "{" )
1830         * K ( 'Interpol.Inside' , ( 1 - S "}:\"r" - "'''' ) ^ 0 )
1831         * Q ( P ":" * ( 1 - S "}:\"r" - "'''' ) ^ 0 ) ^ -1
1832         * K ( 'String.Interpol' , "}" )
1833         +
1834         Q ( ( 1 - P "'''' " - S "{}\"r" ) ^ 1 )
1835         +
1836         EOL
1837       ) ^ 0
1838     +
1839     Q ( ( S "rR" ) ^ -1 * "'''' " )
1840     * (
1841       Q ( ( 1 - P "'''' " - S "\"r%" ) ^ 1 )
1842       +
1843       PercentInterpol
1844       +
1845       P "%"
1846       +
1847       EOL
1848     ) ^ 0
1849   )
1850   * Q "'''' " )
1851
1852
1853 local DoubleLongString =
1854   WithStyle ( 'String.Long' ,
1855     (
1856       Q ( S "fF" * "\"\"\"\" " )
1857       * (
1858         K ( 'String.Interpol' , "{" )
1859         * K ( 'Interpol.Inside' , ( 1 - S "}:\"r" - "\"\"\"\" ) ^ 0 )
1860         * Q ( ":" * ( 1 - S "}:\"r" - "\"\"\"\" ) ^ 0 ) ^ -1
1861         * K ( 'String.Interpol' , "}" )
1862         +
1863         Q ( ( 1 - S "{}\"r" - "\"\"\"\" ) ^ 1 )
1864         +
1865         EOL
1866       ) ^ 0
1867     +
1868     Q ( S "rR" ^ -1 * "\"\"\"\" " )
1869     * (
1870       Q ( ( 1 - P "\"\"\"\" " - S "%\"r" ) ^ 1 )
1871       +
1872       PercentInterpol
1873       +
1874       P "%"
1875       +
1876       EOL
1877     ) ^ 0
1878   )
1879   * Q "\"\"\"\" "
1880 )
1881 local LongString = SingleLongString + DoubleLongString

```

We have a LPEG for the Python docstrings. That LPEG will be used in the LPEG DefFunction which deals with the whole preamble of a function definition (which begins with `def`).

```

1882 local StringDoc =

```

```

1883 K ( 'String.Doc' , P "r" ^ -1 * "\\\" )
1884 * ( K ( 'String.Doc' , ( 1 - P "\\\" - "\r" ) ^ 0 ) * EOL
1885 * Tab ^ 0
1886 ) ^ 0
1887 * K ( 'String.Doc' , ( 1 - P "\\\" - "\r" ) ^ 0 * "\\\" )

```

**The comments in the Python listings** We define different LPEG dealing with comments in the Python listings.

```

1888 local Comment =
1889   WithStyle ( 'Comment' ,
1890     Q "#" * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
1891     * ( EOL + -1 )

```

**DefFunction** The following LPEG expression will be used for the parameters in the *argspec* of a Python function. It's necessary to use a *grammar* because that pattern mainly checks the correct nesting of the delimiters (and it's known in the theory of formal languages that this can't be done with regular expressions *stricto sensu* only).

```

1892 local expression =
1893   P { "E" ,
1894     E = ( "" * ( P "\\'" + 1 - S "\\r" ) ^ 0 * "'"
1895       + "\" * ( P "\\\" + 1 - S "\\r" ) ^ 0 * "\"
1896       + "{" * V "F" * "}"
1897       + "(" * V "F" * ")"
1898       + "[" * V "F" * "]"
1899       + ( 1 - S "{}()[]\r," ) ^ 0 ,
1900     F = ( "{" * V "F" * "}"
1901       + "(" * V "F" * ")"
1902       + "[" * V "F" * "]"
1903       + ( 1 - S "{}()[]\r\" ) ^ 0
1904   }

```

We will now define a LPEG Params that will catch the list of parameters (that is to say the *argspec*) in the definition of a Python function. For example, in the line of code

```
def MyFunction(a,b,x=10,n:int): return n
```

the LPEG Params will be used to catch the chunk `a,b,x=10,n:int`.

```

1905 local Params =
1906   P { "E" ,
1907     E = ( V "F" * ( Q "," * V "F" ) ^ 0 ) ^ -1 ,
1908     F = SkipSpace * ( Identifier + Q "*args" + Q "**kwargs" ) * SkipSpace
1909       * (
1910         K ( 'InitialValues' , "=" * expression )
1911         + Q ":" * SkipSpace * K ( 'Name.Type' , identifier )
1912       ) ^ -1
1913   }

```

The following LPEG DefFunction catches a keyword `def` and the following name of function *but also everything else until a potential docstring*. That's why this definition of LPEG must occur (in the file `piton.sty`) after the definition of several other LPEG such as `Comment`, `CommentLaTeX`, `Params`, `StringDoc`...

```

1914 local DefFunction =
1915   K ( 'Keyword' , "def" )
1916   * Space
1917   * K ( 'Name.Function.Internal' , identifier )
1918   * SkipSpace
1919   * Q "(" * Params * Q ")"
1920   * SkipSpace
1921   * ( Q "->" * SkipSpace * K ( 'Name.Type' , identifier ) ) ^ -1

```

Here, we need a `piton` style `ParseAgain` which will be linked to `\@@_piton:n` (that means that the capture will be parsed once again by `piton`). We could avoid that kind of trick by using a non-terminal of a grammar but we have probably here a better legibility.

```

1922 * K ( 'ParseAgain.noCR' , ( 1 - S ":\r" ) ^ 0 )
1923 * Q ":"
1924 * ( SkipSpace
1925     * ( EOL + CommentLaTeX + Comment ) -- in all cases, that contains an EOL
1926     * Tab ^ 0
1927     * SkipSpace
1928     * StringDoc ^ 0 -- there may be additionnal docstrings
1929 ) ^ -1

```

Remark that, in the previous code, `CommentLaTeX` *must* appear before `Comment`: there is no commutativity of the addition for the *parsing expression grammars* (PEG).

If the word `def` is not followed by an identifier and parenthesis, it will be caught as keyword by the LPEG `Keyword` (useful if, for example, the final user wants to speak of the keyword `def`).

### Miscellaneous

```

1930 local ExceptionInConsole = Exception * Q ( ( 1 - P "\r" ) ^ 0 ) * EOL

```

**The main LPEG for the language Python** First, the main loop :

```

1931 local Main =
1932     space ^ 1 * -1
1933     + space ^ 0 * EOL
1934     + Space
1935     + Tab
1936     + Escape + EscapeMath
1937     + CommentLaTeX
1938     + Beamer
1939     + DetectedCommands
1940     + LongString
1941     + Comment
1942     + ExceptionInConsole
1943     + Delim
1944     + Operator
1945     + OperatorWord * ( Space + Punct + Delim + EOL + -1 )
1946     + ShortString
1947     + Punct
1948     + FromImport
1949     + RaiseException
1950     + DefFunction
1951     + DefClass
1952     + Keyword * ( Space + Punct + Delim + EOL + -1 )
1953     + Decorator
1954     + Builtin * ( Space + Punct + Delim + EOL + -1 )
1955     + Identifier
1956     + Number
1957     + Word

```

Here, we must not put `local`!

```

1958 LPEG1['python'] = Main ^ 0

```

We recall that each line in the Python code to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`<sup>35</sup>.

```

1959 LPEG2['python'] =
1960     Ct (

```

---

<sup>35</sup>Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

1961     ( space ^ 0 * "\r" ) ^ -1
1962     * BeamerBeginEnvironments
1963     * PromptHastyDetection
1964     * Lc '\\@@_begin_line:'
1965     * Prompt
1966     * SpaceIndentation ^ 0
1967     * LPEG1['python']
1968     * -1
1969     * Lc '\\@@_end_line:'
1970 )

```

### 9.3.2 The language Ocaml

```

1971 local Delim = Q ( P "[" + "]" + S "[]" )
1972 local Punct = Q ( S ",:;! " )

```

The identifiers caught by `cap_identifier` begin with a cap. In OCaml, it's used for the constructors of types and for the modules.

```

1973 local cap_identifier = R "AZ" * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
1974 local Constructor = K ( 'Name.Constructor' , cap_identifier )
1975 local ModuleType = K ( 'Name.Type' , cap_identifier )

```

The identifiers which begin with a lower case letter or an underscore are used elsewhere in OCaml.

```

1976 local identifier = ( R "az" + "_" ) * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
1977 local Identifier = K ( 'Identifier' , identifier )

```

Now, we deal with the records because we want to catch the names of the fields of those records in all circumstances.

```

1978 local expression_for_fields =
1979   P { "E" ,
1980     E = (   "{" * V "F" * "}"
1981           + "(" * V "F" * ")"
1982           + "[" * V "F" * "]"
1983           + "\"" * ( P "\\\"" + 1 - S "\\r" ) ^ 0 * "\""
1984           + "'" * ( P "\\'" + 1 - S "'r" ) ^ 0 * "'"
1985           + ( 1 - S "{}()[]\r;" ) ^ 0 ,
1986     F = (   "{" * V "F" * "}"
1987           + "(" * V "F" * ")"
1988           + "[" * V "F" * "]"
1989           + ( 1 - S "{}()[]\r\"" ) ^ 0
1990   }
1991 local OneFieldDefinition =
1992   ( K ( 'Keyword' , "mutable" ) * SkipSpace ) ^ -1
1993   * K ( 'Name.Field' , identifier ) * SkipSpace
1994   * Q ":" * SkipSpace
1995   * K ( 'Name.Type' , expression_for_fields )
1996   * SkipSpace
1997
1998 local OneField =
1999   K ( 'Name.Field' , identifier ) * SkipSpace
2000   * Q "=" * SkipSpace
2001   * ( expression_for_fields
2002     / ( function ( s ) return LPEG1['ocaml'] : match ( s ) end )
2003   )
2004   * SkipSpace
2005
2006 local Record =
2007   Q "{" * SkipSpace
2008   *
2009   (
2010     OneFieldDefinition * ( Q ";" * SkipSpace * OneFieldDefinition ) ^ 0
2011     +
2012     OneField * ( Q ";" * SkipSpace * OneField ) ^ 0

```

```

2013     )
2014     *
2015     Q "]"

```

Now, we deal with the notations with points (eg: `List.length`). In OCaml, such notation is used for the fields of the records and for the modules.

```

2016 local DotNotation =
2017   (
2018     K ( 'Name.Module' , cap_identifier )
2019     * Q "."
2020     * ( Identifier + Constructor + Q "(" + Q "[" + Q "{" )
2021     +
2022     Identifier
2023     * Q "."
2024     * K ( 'Name.Field' , identifier )
2025   )
2026 * ( Q "." * K ( 'Name.Field' , identifier ) ) ^ 0
2027 local Operator =
2028   K ( 'Operator' ,
2029     P "!=" + "<>" + "==" + "<<" + ">>" + "<=" + ">=" + "==" + "||" + "&&" +
2030     "/" + "*" + ";" + ":" + "->" + "+" + "-" + "." + "/" +
2031     + S "--+/*%=<>&@|" )
2032
2033 local OperatorWord =
2034   K ( 'Operator.Word' ,
2035     P "and" + "asr" + "land" + "lor" + "lsl" + "lxor" + "mod" + "or" )
2036
2037 local Keyword =
2038   K ( 'Keyword' ,
2039     P "assert" + "and" + "as" + "begin" + "class" + "constraint" + "done"
2040     + "downto" + "do" + "else" + "end" + "exception" + "external" + "for" +
2041     "function" + "functor" + "fun" + "if" + "include" + "inherit" + "initializer"
2042     + "in" + "lazy" + "let" + "match" + "method" + "module" + "mutable" + "new" +
2043     "object" + "of" + "open" + "private" + "raise" + "rec" + "sig" + "struct" +
2044     "then" + "to" + "try" + "type" + "value" + "val" + "virtual" + "when" +
2045     "while" + "with" )
2046   + K ( 'Keyword.Constant' , P "true" + "false" )
2047
2048 local Builtin =
2049   K ( 'Name.Builtin' , P "not" + "incr" + "decr" + "fst" + "snd" )

```

The following exceptions are exceptions in the standard library of OCaml (Stdlib).

```

2050 local Exception =
2051   K ( 'Exception' ,
2052     P "Division_by_zero" + "End_of_File" + "Failure" + "Invalid_argument" +
2053     "Match_failure" + "Not_found" + "Out_of_memory" + "Stack_overflow" +
2054     "Sys_blocked_io" + "Sys_error" + "Undefined_recursive_module" )

```

## The characters in OCaml

```

2055 local Char =
2056   K ( 'String.Short' , "" * ( ( 1 - P "" ) ^ 0 + "\\\" ) * "" )

```

## Beamer

```

2057 braces = Compute_braces ( "\" * ( 1 - S "\" ) ^ 0 * "\" )
2058 if piton.beamer then
2059   Beamer = Compute_Beamer ( 'ocaml' , "\" * ( 1 - S "\" ) ^ 0 * "\" )
2060 end
2061 DetectedCommands = Compute_DetectedCommands ( 'ocaml' , braces )

```

```
2062 LPEG_cleaner['ocaml'] = Compute_LPEG_cleaner ( 'ocaml' , braces )
```

**The strings en OCaml** We need a pattern `ocaml_string` without captures because it will be used within the comments of OCaml.

```
2063 local ocaml_string =
2064     Q "\""
2065     * (
2066         VisualSpace
2067         +
2068         Q ( ( 1 - S "\r" ) ^ 1 )
2069         +
2070         EOL
2071         ) ^ 0
2072     * Q "\""
2073 local String = WithStyle ( 'String.Long' , ocaml_string )
```

Now, the “quoted strings” of OCaml (for example `{ext|Essai|ext}`).

For those strings, we will do two consecutive analysis. First an analysis to determine the whole string and, then, an analysis for the potential visual spaces and the EOL in the string.

The first analysis require a match-time capture. For explanations about that programmation, see the paragraphe *Lua’s long strings* in [www.inf.puc-rio.br/~roberto/lpeg](http://www.inf.puc-rio.br/~roberto/lpeg).

```
2074 local ext = ( R "az" + "_" ) ^ 0
2075 local open = "{" * Cg ( ext , 'init' ) * "|"
2076 local close = "|" * C ( ext ) * "}"
2077 local closeeq =
2078     Cmt ( close * Cb ( 'init' ) ,
2079         function ( s , i , a , b ) return a == b end )
```

The LPEG `QuotedStringBis` will do the second analysis.

```
2080 local QuotedStringBis =
2081     WithStyle ( 'String.Long' ,
2082         (
2083             Space
2084             +
2085             Q ( ( 1 - S "\r" ) ^ 1 )
2086             +
2087             EOL
2088             ) ^ 0 )
```

We use a “function capture” (as called in the official documentation of the LPEG) in order to do the second analysis on the result of the first one.

```
2089 local QuotedString =
2090     C ( open * ( 1 - closeeq ) ^ 0 * close ) /
2091     ( function ( s ) return QuotedStringBis : match ( s ) end )
```

**The comments in the OCaml listings** In OCaml, the delimiters for the comments are (`*` and `*`). There are unsymmetrical and OCaml allows those comments to be nested. That’s why we need a grammar.

In these comments, we embed the math comments (between `$` and `$`) and we embed also a treatment for the end of lines (since the comments may be multi-lines).

```
2092 local Comment =
2093     WithStyle ( 'Comment' ,
2094         P {
2095             "A" ,
2096             A = Q "(*"
2097                 * ( V "A"
2098                     + Q ( ( 1 - S "\r$\\" - "(*" - "*" ) ^ 1 ) -- $
```

```

2099         + ocaml_string
2100         + "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * "$" -- $
2101         + EOL
2102     ) ^ 0
2103     * Q "*" )
2104 } )

```

## The DefFunction

```

2105 local balanced_parens =
2106   P { "E" , E = ( "(" * V "E" * ")" + 1 - S "(" ) ^ 0 }
2107 local Argument =
2108   K ( 'Identifier' , identifier )
2109   + Q "(" * SkipSpace
2110     * K ( 'Identifier' , identifier ) * SkipSpace
2111     * Q ":" * SkipSpace
2112     * K ( 'Name.Type' , balanced_parens ) * SkipSpace
2113     * Q ")" )

```

Despite its name, then LPEG DefFunction deals also with `let open` which opens locally a module.

```

2114 local DefFunction =
2115   K ( 'Keyword' , "let open" )
2116   * Space
2117   * K ( 'Name.Module' , cap_identifier )
2118   +
2119   K ( 'Keyword' , P "let rec" + "let" + "and" )
2120   * Space
2121   * K ( 'Name.Function.Internal' , identifier )
2122   * Space
2123   * (
2124     Q "=" * SkipSpace * K ( 'Keyword' , "function" )
2125     +
2126     Argument
2127     * ( SkipSpace * Argument ) ^ 0
2128     * (
2129       SkipSpace
2130       * Q ":"
2131       * K ( 'Name.Type' , ( 1 - P "=" ) ^ 0 )
2132     ) ^ -1
2133   )

```

**The DefModule** The following LPEG will be used in the definitions of modules but also in the definitions of *types* of modules.

```

2134 local DefModule =
2135   K ( 'Keyword' , "module" ) * Space
2136   *
2137   (
2138     K ( 'Keyword' , "type" ) * Space
2139     * K ( 'Name.Type' , cap_identifier )
2140     +
2141     K ( 'Name.Module' , cap_identifier ) * SkipSpace
2142     *
2143     (
2144       Q "(" * SkipSpace
2145       * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2146       * Q ":" * SkipSpace
2147       * K ( 'Name.Type' , cap_identifier ) * SkipSpace
2148       *
2149       (
2150         Q "," * SkipSpace

```

```

2151         * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2152         * Q ":" * SkipSpace
2153         * K ( 'Name.Type' , cap_identifier ) * SkipSpace
2154     ) ^ 0
2155     * Q ")"
2156 ) ^ -1
2157 *
2158 (
2159     Q "=" * SkipSpace
2160     * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2161     * Q "("
2162     * K ( 'Name.Module' , cap_identifier ) * SkipSpace
2163     *
2164     (
2165         Q ","
2166         *
2167         K ( 'Name.Module' , cap_identifier ) * SkipSpace
2168     ) ^ 0
2169     * Q ")"
2170 ) ^ -1
2171 )
2172 +
2173 K ( 'Keyword' , P "include" + "open" )
2174 * Space * K ( 'Name.Module' , cap_identifier )

```

### The parameters of the types

```

2175 local TypeParameter = K ( 'TypeParameter' , "'" * alpha * # ( 1 - P "'" ) )

```

### The main LPEG for the language OCaml First, the main loop :

```

2176 local Main =
2177     space ^ 1 * -1
2178 + space ^ 0 * EOL
2179 + Space
2180 + Tab
2181 + Escape + EscapeMath
2182 + Beamer
2183 + DetectedCommands
2184 + TypeParameter
2185 + String + QuotedString + Char
2186 + Comment
2187 + Delim
2188 + Operator
2189 + Punct
2190 + FromImport
2191 + Exception
2192 + DefFunction
2193 + DefModule
2194 + Record
2195 + Keyword * ( Space + Punct + Delim + EOL + -1 )
2196 + OperatorWord * ( Space + Punct + Delim + EOL + -1 )
2197 + Builtin * ( Space + Punct + Delim + EOL + -1 )
2198 + DotNotation
2199 + Constructor
2200 + Identifier
2201 + Number
2202 + Word
2203
2204 LPEG1['ocaml'] = Main ^ 0

```

We recall that each line in the code to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`<sup>36</sup>.

```

2205 LPEG2['ocaml'] =
2206   Ct (
2207     ( space ^ 0 * "\r" ) ^ -1
2208     * BeamerBeginEnvironments
2209     * Lc '\\@@_begin_line:'
2210     * SpaceIndentation ^ 0
2211     * LPEG1['ocaml']
2212     * -1
2213     * Lc '\\@@_end_line:'
2214   )

```

### 9.3.3 The language C

```

2215 local Delim = Q ( S "{[()]} " )
2216 local Punct = Q ( S ",:;! " )

```

Some strings of length 2 are explicit because we want the corresponding ligatures available in some fonts such as *Fira Code* to be active.

```

2217 local identifier = letter * alphanum ^ 0
2218
2219 local Operator =
2220   K ( 'Operator' ,
2221     P "!=" + "==" + "<<" + ">>" + "<=" + ">=" + "||" + "&&"
2222     + S "-~/*%=<>&.@|!" )
2223
2224 local Keyword =
2225   K ( 'Keyword' ,
2226     P "alignas" + "asm" + "auto" + "break" + "case" + "catch" + "class" +
2227     "const" + "constexpr" + "continue" + "decltype" + "do" + "else" + "enum" +
2228     "extern" + "for" + "goto" + "if" + "nexcept" + "private" + "public" +
2229     "register" + "restricted" + "return" + "static" + "static_assert" +
2230     "struct" + "switch" + "thread_local" + "throw" + "try" + "typedef" +
2231     "union" + "using" + "virtual" + "volatile" + "while"
2232   )
2233   + K ( 'Keyword.Constant' , P "default" + "false" + "NULL" + "nullptr" + "true" )
2234
2235 local Builtin =
2236   K ( 'Name.Builtin' ,
2237     P "alignof" + "malloc" + "printf" + "scanf" + "sizeof" )
2238
2239 local Type =
2240   K ( 'Name.Type' ,
2241     P "bool" + "char" + "char16_t" + "char32_t" + "double" + "float" + "int" +
2242     "int8_t" + "int16_t" + "int32_t" + "int64_t" + "long" + "short" + "signed"
2243     + "unsigned" + "void" + "wchar_t" )
2244
2245 local DefFunction =
2246   Type
2247   * Space
2248   * Q "*" ^ -1
2249   * K ( 'Name.Function.Internal' , identifier )
2250   * SkipSpace
2251   * # P "("

```

We remind that the marker # of LPEG specifies that the pattern will be detected but won't consume any character.

---

<sup>36</sup>Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

The following LPEG DefClass will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style Name.Class).

Example: `class myclass:`

```
2252 local DefClass =
2253   K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )
```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG Keyword (useful if we want to type a list of keywords).

### The strings of C

```
2254 String =
2255   WithStyle ( 'String.Long' ,
2256     Q "\""
2257     * ( VisualSpace
2258       + K ( 'String.Interpol' ,
2259         "% " * ( S "difcspXou" + "ld" + "li" + "hd" + "hi" )
2260       )
2261       + Q ( ( P "\\\"" + 1 - S " \"" ) ^ 1 )
2262     ) ^ 0
2263     * Q "\""
2264   )
```

### Beamer

```
2265 braces = Compute_braces ( "\"" * ( 1 - S "\"" ) ^ 0 * "\"" )
2266 if piton.beamer then Beamer = Compute_Beamer ( 'c' , braces ) end
2267 DetectedCommands = Compute_DetectedCommands ( 'c' , braces )
2268 LPEG_cleaner['c'] = Compute_LPEG_cleaner ( 'c' , braces )
```

### The directives of the preprocessor

```
2269 local Preproc = K ( 'Preproc' , "#" * ( 1 - P "\r" ) ^ 0 ) * ( EOL + -1 )
```

**The comments in the C listings** We define different LPEG dealing with comments in the C listings.

```
2270 local Comment =
2271   WithStyle ( 'Comment' ,
2272     Q "//" * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
2273     * ( EOL + -1 )
2274
2275 local LongComment =
2276   WithStyle ( 'Comment' ,
2277     Q "/*"
2278     * ( CommentMath + Q ( ( 1 - P "*/" - S "$\r" ) ^ 1 ) + EOL ) ^ 0
2279     * Q "*/"
2280   ) -- $
```

The main LPEG for the language C First, the main loop :

```

2281 local Main =
2282     space ^ 1 * -1
2283   + space ^ 0 * EOL
2284   + Space
2285   + Tab
2286   + Escape + EscapeMath
2287   + CommentLaTeX
2288   + Beamer
2289   + DetectedCommands
2290   + Preproc
2291   + Comment + LongComment
2292   + Delim
2293   + Operator
2294   + String
2295   + Punct
2296   + DefFunction
2297   + DefClass
2298   + Type * ( Q "*" ^ -1 + Space + Punct + Delim + EOL + -1 )
2299   + Keyword * ( Space + Punct + Delim + EOL + -1 )
2300   + Builtin * ( Space + Punct + Delim + EOL + -1 )
2301   + Identifier
2302   + Number
2303   + Word

```

Here, we must not put local!

```

2304 LPEG1['c'] = Main ^ 0

```

We recall that each line in the C code to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`<sup>37</sup>.

```

2305 LPEG2['c'] =
2306   Ct (
2307     ( space ^ 0 * P "\r" ) ^ -1
2308     * BeamerBeginEnvironments
2309     * Lc '\\@@_begin_line:'
2310     * SpaceIndentation ^ 0
2311     * LPEG1['c']
2312     * -1
2313     * Lc '\\@@_end_line:'
2314   )

```

### 9.3.4 The language SQL

```

2315 local function LuaKeyword ( name )
2316 return
2317   Lc [[{\PitonStyle{Keyword}{}}]
2318   * Q ( Cmt (
2319     C ( identifier ) ,
2320     function ( s , i , a ) return string.upper ( a ) == name end
2321   )
2322   )
2323   * Lc "}"
2324 end

```

In the identifiers, we will be able to catch those containing spaces, that is to say like "last name".

```

2325 local identifier =
2326   letter * ( alphanum + "-" ) ^ 0

```

---

<sup>37</sup>Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

2327 + '"' * ( ( alphanum + space - '"' ) ^ 1 ) * '"'
2328
2329

```

```

2330 local Operator =
2331 K ( 'Operator' , P "=" + "!=" + "<>" + ">=" + ">" + "<=" + "<" + S "*/" )

```

In SQL, the keywords are case-insensitive. That's why we have a little complication. We will catch the keywords with the identifiers and, then, distinguish the keywords with a Lua function. However, some keywords will be caught in special LPEG because we want to detect the names of the SQL tables.

```

2332 local function Set ( list )
2333   local set = { }
2334   for _, l in ipairs ( list ) do set[l] = true end
2335   return set
2336 end
2337
2338 local set_keywords = Set
2339 {
2340   "ADD" , "AFTER" , "ALL" , "ALTER" , "AND" , "AS" , "ASC" , "BETWEEN" , "BY" ,
2341   "CHANGE" , "COLUMN" , "CREATE" , "CROSS JOIN" , "DELETE" , "DESC" , "DISTINCT" ,
2342   "DROP" , "FROM" , "GROUP" , "HAVING" , "IN" , "INNER" , "INSERT" , "INTO" , "IS" ,
2343   "JOIN" , "LEFT" , "LIKE" , "LIMIT" , "MERGE" , "NOT" , "NULL" , "ON" , "OR" ,
2344   "ORDER" , "OVER" , "RIGHT" , "SELECT" , "SET" , "TABLE" , "THEN" , "TRUNCATE" ,
2345   "UNION" , "UPDATE" , "VALUES" , "WHEN" , "WHERE" , "WITH"
2346 }
2347
2348 local set_builtins = Set
2349 {
2350   "AVG" , "COUNT" , "CHAR LENGHT" , "CONCAT" , "CURDATE" , "CURRENT_DATE" ,
2351   "DATE_FORMAT" , "DAY" , "LOWER" , "LTRIM" , "MAX" , "MIN" , "MONTH" , "NOW" ,
2352   "RANK" , "ROUND" , "RTRIM" , "SUBSTRING" , "SUM" , "UPPER" , "YEAR"
2353 }

```

The LPEG Identifier will catch the identifiers of the fields but also the keywords and the built-in functions of SQL. It will *not* catch the names of the SQL tables.

```

2354 local Identifier =
2355 C ( identifier ) /
2356 (
2357   function (s)
2358     if set_keywords[string.upper(s)] -- the keywords are case-insensitive in SQL

```

Remind that, in Lua, it's possible to return *several* values.

```

2359     then return { "{\PitonStyle{Keyword}{" } ,
2360                 { luatexbase.catcodetables.other , s } ,
2361                 { "}" } }
2362     else if set_builtins[string.upper(s)]
2363     then return { "{\PitonStyle{Name.Builtin}{" } ,
2364                 { luatexbase.catcodetables.other , s } ,
2365                 { "}" } }
2366     else return { "{\PitonStyle{Name.Field}{" } ,
2367                 { luatexbase.catcodetables.other , s } ,
2368                 { "}" } }
2369     end
2370   end
2371 end
2372 )

```

## The strings of SQL

```

2373 local String = K ( 'String.Long' , '"' * ( 1 - P '"' ) ^ 1 * '"' )

```

## Beamer

```
2374 braces = Compute_braces ( String )
2375 if piton.beamer then Beamer = Compute_Beamer ( 'sql' , braces ) end
2376 DetectedCommands = Compute_DetectedCommands ( 'sql' , braces )
2377 LPEG_cleaner['sql'] = Compute_LPEG_cleaner ( 'sql' , braces )
```

**The comments in the SQL listings** We define different LPEG dealing with comments in the SQL listings.

```
2378 local Comment =
2379     WithStyle ( 'Comment' ,
2380         Q "--" -- syntax of SQL92
2381         * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
2382     * ( EOL + -1 )
2383
2384 local LongComment =
2385     WithStyle ( 'Comment' ,
2386         Q "/*"
2387         * ( CommentMath + Q ( ( 1 - P "*/" - S "$\r" ) ^ 1 ) + EOL ) ^ 0
2388         * Q "*/"
2389     ) -- $
```

## The main LPEG for the language SQL

```
2390 local TableField =
2391     K ( 'Name.Table' , identifier )
2392     * Q "."
2393     * K ( 'Name.Field' , identifier )
2394
2395 local OneField =
2396     (
2397         Q ( "(" * ( 1 - P ")" ) ^ 0 * ")" )
2398         +
2399         K ( 'Name.Table' , identifier )
2400         * Q "."
2401         * K ( 'Name.Field' , identifier )
2402         +
2403         K ( 'Name.Field' , identifier )
2404     )
2405     * (
2406         Space * LuaKeyword "AS" * Space * K ( 'Name.Field' , identifier )
2407     ) ^ -1
2408     * ( Space * ( LuaKeyword "ASC" + LuaKeyword "DESC" ) ) ^ -1
2409
2410 local OneTable =
2411     K ( 'Name.Table' , identifier )
2412     * (
2413         Space
2414         * LuaKeyword "AS"
2415         * Space
2416         * K ( 'Name.Table' , identifier )
2417     ) ^ -1
2418
2419 local WeCatchTableNames =
2420     LuaKeyword "FROM"
2421     * ( Space + EOL )
2422     * OneTable * ( SkipSpace * Q "," * SkipSpace * OneTable ) ^ 0
2423     + (
2424         LuaKeyword "JOIN" + LuaKeyword "INTO" + LuaKeyword "UPDATE"
2425         + LuaKeyword "TABLE"
```

```

2426 )
2427 * ( Space + EOL ) * OneTable

```

First, the main loop :

```

2428 local Main =
2429     space ^ 1 * -1
2430 + space ^ 0 * EOL
2431 + Space
2432 + Tab
2433 + Escape + EscapeMath
2434 + CommentLaTeX
2435 + Beamer
2436 + DetectedCommands
2437 + Comment + LongComment
2438 + Delim
2439 + Operator
2440 + String
2441 + Punct
2442 + WeCatchTableNames
2443 + ( TableField + Identifier ) * ( Space + Operator + Punct + Delim + EOL + -1 )
2444 + Number
2445 + Word

```

Here, we must not put local!

```

2446 LPEG1['sql'] = Main ^ 0

```

We recall that each line in the code to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`<sup>38</sup>.

```

2447 LPEG2['sql'] =
2448 Ct (
2449     ( space ^ 0 * "\r" ) ^ -1
2450     * BeamerBeginEnvironments
2451     * Lc [ [ \@@_begin_line: ] ]
2452     * SpaceIndentation ^ 0
2453     * LPEG1['sql']
2454     * -1
2455     * Lc [ [ \@@_end_line: ] ]
2456 )

```

### 9.3.5 The language “Minimal”

```

2457 local Punct = Q ( S ",:;!\" )
2458
2459 local Comment =
2460     WithStyle ( 'Comment' ,

2516   )
2517
2518 % \bigskip
2519 % \subsubsection{The function Parse}
2520 %
2521 % \medskip
2522 % The function |Parse| is the main function of the package \pkg{piton}. It
2523 % parses its argument and sends back to LaTeX the code with interlaced
2524 % formatting LaTeX instructions. In fact, everything is done by the
2525 % \textsc{lpeg} corresponding to the considered language (|LPEG2[language]|)
2526 % which returns as capture a Lua table containing data to send to LaTeX.
2527 %
2528 % \bigskip
2529 % \begin{macrocode}
2530 function piton.Parse ( language , code )
2531   local t = LPEG2[language] : match ( code )
2532   if t == nil
2533   then
2534     sprintL3 [[ \@@_error_or_warning:n { syntax-error } ]]
2535     return -- to exit in force the function
2536   end
2537   local left_stack = {}
2538   local right_stack = {}

```

```

2539 for _ , one_item in ipairs ( t ) do
2540   if one_item[1] == "EOL" then
2541     for _ , s in ipairs ( right_stack ) do
2542       tex.sprint ( s )
2543     end
2544     for _ , s in ipairs ( one_item[2] ) do
2545       tex.tprint ( s )
2546     end
2547     for _ , s in ipairs ( left_stack ) do
2548       tex.sprint ( s )
2549     end
2550   else

```

Here is an example of an item beginning with "Open".

```
{ "Open" , "\begin{uncover}<2>" , "\end{cover}" }
```

In order to deal with the ends of lines, we have to close the environment (`{cover}` in this example) at the end of each line and reopen it at the beginning of the new line. That's why we use two Lua stacks, called `left_stack` and `right_stack`. `left_stack` will be for the elements like `\begin{uncover}<2>` and `right_stack` will be for the elements like `\end{cover}`.

```

2551   if one_item[1] == "Open" then
2552     tex.sprint( one_item[2] )
2553     table.insert ( left_stack , one_item[2] )
2554     table.insert ( right_stack , one_item[3] )
2555   else
2556     if one_item[1] == "Close" then
2557       tex.sprint ( right_stack[#right_stack] )
2558       left_stack[#left_stack] = nil
2559       right_stack[#right_stack] = nil
2560     else
2561       tex.tprint ( one_item )
2562     end
2563   end
2564 end
2565 end
2566 end

```

The function `ParseFile` will be used by the LaTeX command `\PitonInputFile`. That function merely reads the file (between `first_line` and `last_line`) and then apply the function `Parse` to the resulting Lua string.

```

2567 function piton.ParseFile ( language , name , first_line , last_line , split )
2568   local s = ''
2569   local i = 0
2570   for line in io.lines ( name ) do
2571     i = i + 1
2572     if i >= first_line then
2573       s = s .. '\r' .. line
2574     end
2575     if i >= last_line then break end
2576   end

```

We extract the BOM of utf-8, if present.

```

2577   if string.byte ( s , 1 ) == 13 then
2578     if string.byte ( s , 2 ) == 239 then
2579       if string.byte ( s , 3 ) == 187 then
2580         if string.byte ( s , 4 ) == 191 then
2581           s = string.sub ( s , 5 , -1 )
2582         end
2583       end
2584     end
2585   end
2586   if split == 1 then
2587     piton.GobbleSplitParse ( language , 0 , s )
2588   else
2589     sprintL3 [[ \bool_if:NT \g_@@_footnote_bool \savenotes \vtop \bgroup ]]

```

```

2590 piton.Parse ( language , s )
2591 sprintL3
2592     [[\vspace{2.5pt}\egroup\bool_if:NT\g_@@_footnote_bool\endsavenotes\par]]
2593 end
2594 end

```

### 9.3.6 Two variants of the function Parse with integrated preprocessors

The following command will be used by the user command `\piton`. For that command, we have to undo the duplication of the symbols #.

```

2595 function piton.ParseBis ( lang , code )
2596     local s = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( code )
2597     return piton.Parse ( lang , s )
2598 end

```

The following command will be used when we have to parse some small chunks of code that have yet been parsed. They are re-scanned by LaTeX because it has been required by `\@@_piton:n` in the `piton` style of the syntactic element. In that case, you have to remove the potential `\@@_breakable_space:` that have been inserted when the key `break-lines` is in force.

```

2599 function piton.ParseTer ( lang , code )

```

Be careful: we have to write `[[\@@_breakable_space: ]]` with a space after the name of the LaTeX command `\@@_breakable_space:`.

```

2600     local s = ( Cs ( ( P [[\@@_breakable_space: ]] / ' ' + 1 ) ^ 0 ) )
2601                 : match ( code )
2602     return piton.Parse ( lang , s )
2603 end

```

### 9.3.7 Preprocessors of the function Parse for gobble

We deal now with preprocessors of the function `Parse` which are needed when the “gobble mechanism” is used.

The following LPEG returns as capture the minimal number of spaces at the beginning of the lines of code.

```

2604 local AutoGobbleLPEG =
2605     ( (
2606         P " " ^ 0 * "\r"
2607         +
2608         Ct ( C " " ^ 0 ) / table.getn
2609         * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 * "\r"
2610     ) ^ 0
2611     * ( Ct ( C " " ^ 0 ) / table.getn
2612         * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
2613 ) / math.min

```

The following LPEG is similar but works with the tabulations.

```

2614 local TabsAutoGobbleLPEG =
2615     (
2616     (
2617         P "\t" ^ 0 * "\r"
2618         +
2619         Ct ( C "\t" ^ 0 ) / table.getn
2620         * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 * "\r"
2621     ) ^ 0
2622     * ( Ct ( C "\t" ^ 0 ) / table.getn
2623         * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
2624 ) / math.min

```

The following LPEG returns as capture the number of spaces at the last line, that is to say before the `\end{Piton}` (and usually it's also the number of spaces before the corresponding `\begin{Piton}` because that's the traditional way to indent in LaTeX).

```

2625 local EnvGobbleLPEG =
2626     ( ( 1 - P "\r" ) ^ 0 * "\r" ) ^ 0
2627     * Ct ( C " " ^ 0 * -1 ) / table.getn
2628 local function remove_before_cr ( input_string )
2629     local match_result = ( P "\r" ) : match ( input_string )
2630     if match_result then
2631         return string.sub ( input_string , match_result )
2632     else
2633         return input_string
2634     end
2635 end

```

The function `gobble` gobbles  $n$  characters on the left of the code. The negative values of  $n$  have special significations.

```

2636 local function gobble ( n , code )
2637     code = remove_before_cr ( code )
2638     if n == 0 then
2639         return code
2640     else
2641         if n == -1 then
2642             n = AutoGobbleLPEG : match ( code )
2643         else
2644             if n == -2 then
2645                 n = EnvGobbleLPEG : match ( code )
2646             else
2647                 if n == -3 then
2648                     n = TabsAutoGobbleLPEG : match ( code )
2649                 end
2650             end
2651         end

```

We have a second test if  $n == 0$  because the, even if the key like `auto-gobble` is in force, it's possible that, in fact, there is no space to gobble...

```

2652     if n == 0 then
2653         return code
2654     else

```

We will now use a LPEG that we have to compute dynamically because it depends on the value of  $n$ .

```

2655         return
2656         ( Ct (
2657             ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
2658             * ( C "\r" * ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
2659             ) ^ 0 )
2660         / table.concat
2661         ) : match ( code )
2662     end
2663 end
2664 end

```

In the following code,  $n$  is the value of `\l_@@_gobble_int`.

```

2665 function piton.GobbleParse ( lang , n , code )
2666     piton.last_code = gobble ( n , code )
2667     piton.last_language = lang
2668     sprintL3 [[ \bool_if:NT \g_@@_footnote_bool \savenotes \vtop \bgroup ]]
2669     piton.Parse ( lang , piton.last_code )
2670     sprintL3
2671     [[[\vspace{2.5pt}\egroup\bool_if:NT\g_@@_footnote_bool\endsavenotes\par]]

```

Now, if the final user has used the key `write` to write the code of the environment on an external file.

```

2672 if piton.write and piton.write ~= '' then
2673   local file = assert ( io.open ( piton.write , piton.write_mode ) )
2674   file:write ( piton.get_last_code ( ) )
2675   file:close ( )
2676 end
2677 end

```

The following function will be used when the key `split-on-empty-lines` is in force. With that key, the informatic code is split in chunks at the empty lines (usually between the informatic functions defined in the informatic code). LaTeX will be able to change the page between the chunks.

```

2678 function piton.GobbleSplitParse ( lang , n , code )
2679   P { "E" ,
2680     E = ( V "F"
2681           * ( P " " ^ 0 * "\r"
2682               / ( function ( x ) sprintL3 [[ \@@incr_visual_line: ]] end )
2683             ) ^ 1
2684           / ( function ( x )
2685               sprintL3 [[ \l_@@split_separation_tl \int_gzero:N \g_@@line_int ]]
2686               end )
2687           ) ^ 0 * V "F" ,

```

The non-terminal F corresponds to a chunk of the informatic code.

```

2688   F = C ( V "G" ^ 0 )

```

The second argument of `.pitonGobbleParse` is the argument `gobble`: we put that argument to 0 because we will have gobbled previously the whole argument `code` (see below).

```

2689   / ( function ( x ) piton.GobbleParse ( lang , 0 , x ) end ) ,

```

The non-terminal G corresponds to a non-empty line of code.

```

2690   G = ( 1 - P "\r" ) ^ 0 * "\r" - ( P " " ^ 0 * "\r" )
2691   } : match ( gobble ( n , code ) )
2692 end

```

The following public Lua function is provided to the developer.

```

2693 function piton.get_last_code ( )
2694   return LPEG_cleaner[piton.last_language] : match ( piton.last_code )
2695 end

```

### 9.3.8 To count the number of lines

```

2696 function piton.CountLines ( code )
2697   local count = 0
2698   for i in code : gmatch ( "\r" ) do count = count + 1 end
2699   sprintL3 ( [[ \int_set:Nn \l_@@nb_lines_int { ]] .. count .. '}' )
2700 end

2701 function piton.CountNonEmptyLines ( code )
2702   local count = 0
2703   count =
2704     ( Ct ( ( P " " ^ 0 * "\r"
2705             + ( 1 - P "\r" ) ^ 0 * C "\r" ) ^ 0
2706           * ( 1 - P "\r" ) ^ 0
2707           * -1
2708           ) / table.getn
2709         ) : match ( code )
2710   sprintL3 ( [[ \int_set:Nn \l_@@nb_non_empty_lines_int { ]] .. count .. '}' )
2711 end

2712 function piton.CountLinesFile ( name )

```

```

2713 local count = 0
2714 for line in io.lines ( name ) do count = count + 1 end
2715 sprintL3 ( [[ \int_set:Nn \l_@@_nb_lines_int { ]] .. count .. '}' )
2716 end

2717 function piton.CountNonEmptyLinesFile ( name )
2718 local count = 0
2719 for line in io.lines ( name )
2720 do if not ( ( P " " ^ 0 * -1 ) : match ( line ) ) then
2721     count = count + 1
2722 end
2723 end
2724 sprintL3 ( [[ \int_set:Nn \l_@@_nb_non_empty_lines_int { ]] .. count .. '}' )
2725 end

```

The following function stores in `\l_@@_first_line_int` and `\l_@@_last_line_int` the numbers of lines of the file `file_name` corresponding to the strings `marker_beginning` and `marker_end`.

```

2726 function piton.ComputeRange(marker_beginning,marker_end,file_name)
2727 local s = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( marker_beginning )
2728 local t = ( Cs ( ( P '##' / '#' + 1 ) ^ 0 ) ) : match ( marker_end )
2729 local first_line = -1
2730 local count = 0
2731 local last_found = false
2732 for line in io.lines ( file_name )
2733 do if first_line == -1
2734     then if string.sub ( line , 1 , #s ) == s
2735         then first_line = count
2736         end
2737     else if string.sub ( line , 1 , #t ) == t
2738         then last_found = true
2739         break
2740     end
2741 end
2742 count = count + 1
2743 end
2744 if first_line == -1
2745 then sprintL3 [[ \@@_error_or_warning:n { begin-marker-not-found } ]]
2746 else if last_found == false
2747     then sprintL3 [[ \@@_error_or_warning:n { end-marker-not-found } ]]
2748     end
2749 end
2750 sprintL3 (
2751     [[ \int_set:Nn \l_@@_first_line_int { ]] .. first_line .. ' + 2 }'
2752     .. [[ \int_set:Nn \l_@@_last_line_int { ]] .. count .. '}' )
2753 end

```

### 9.3.9 To create new languages with the syntax of listings

```

2754 function piton.new_language ( lang , definition )
2755 lang = string.lower ( lang )

2756 local alpha , digit = lpeg.alpha , lpeg.digit
2757 local letter = alpha + S "@_ $" -- $

```

In the following LPEG we have a problem when we try to add `{` and `}`.

```

2758 local other = S "+-*/<>!?:;.()@[]~^=#&\"'\\"$" -- $

2759 function add_to_letter ( c )
2760     if c ~= " " then letter = letter + c end
2761 end
2762 function add_to_digit ( c )

```

```

2763     if c ~= " " then digit = digit + c end
2764 end

```

Of course, the LPEG `b_braces` is for balanced braces (without the question of strings of an informatic language). In fact, it *won't* be used for an informatic language (as dealt by `piton`) but for LaTeX instructions;

```

2765 local strict_braces =
2766   P { "E" ,
2767       E = ( "{" * V "F" * "}" + ( 1 - S ",{" }" ) ) ^ 0 ,
2768       F = ( "{" * V "F" * "}" + ( 1 - S "{" }" ) ) ^ 0
2769   }

```

Now, the first transformation of the definition of the language, as provided by the final user in the argument definition of `piton.new_language`.

```

2770 local cut_definition =
2771   P { "E" ,
2772       E = Ct ( V "F" * ( "," * V "F" ) ^ 0 ) ,
2773       F = Ct ( space ^ 0 * C ( alpha ^ 1 ) * space ^ 0
2774               * ( "=" * space ^ 0 * C ( strict_braces ) ) ^ -1 )
2775   }
2776 local def_table = cut_definition : match ( definition )

```

The definition of the language, provided by the final user of `piton` is now in the Lua table `def_table`. We will use it several times.

The following LPEG will be used to extract arguments in the values of the keys (`morekeywords`, `morecomment`, `morestring`, etc.).

```

2777 local tex_braced_arg = "{" * C ( ( 1 - P "}" ) ^ 0 ) * "}"
2778 local tex_arg = tex_braced_arg + C ( 1 )
2779 local tex_option_arg = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]" + Cc ( nil )
2780 local args_for_morekeywords
2781   = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
2782   * space ^ 0
2783   * tex_option_arg
2784   * space ^ 0
2785   * tex_arg
2786   * space ^ 0
2787   * ( tex_braced_arg + Cc ( nil ) )
2788 local args_for_moredelims
2789   = ( C ( P "*" ^ -2 ) + Cc ( nil ) ) * space ^ 0
2790   * args_for_morekeywords
2791 local args_for_morecomment
2792   = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
2793   * space ^ 0
2794   * tex_option_arg
2795   * space ^ 0
2796   * C ( P ( 1 ) ^ 0 * -1 )
2797 local args_for_tag
2798   = ( P "*" ^ -2 )
2799   * space ^ 0
2800   * ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ 0
2801   * space ^ 0
2802   * tex_arg
2803   * space ^ 0
2804   * tex_arg

```

We scan the definition of the language (i.e. the table `def_table`) in order to detect the potential key `sensitive`. Indeed, we have to catch that key before the treatment of the keywords of the language. We will also look for the potential keys `alsodigit`, `alsoletter` and `tag`.

```

2805 local sensitive = true
2806 local left_tag , right_tag

```

```

2807 for _ , x in ipairs ( def_table ) do
2808   if x[1] == "sensitive" then
2809     if x[2] == nil or ( P "true" ) : match ( x[2] ) then
2810       sensitive = true
2811     else
2812       if ( P "false" + P "f" ) : match ( x[2] ) then sensitive = false end
2813     end
2814   end
2815   if x[1] == "alsodigit" then x[2] : gsub ( ".", add_to_digit ) end
2816   if x[1] == "alsoletter" then x[2] : gsub ( ".", add_to_letter ) end
2817   if x[1] == "tag" then
2818     left_tag , right_tag = args_for_tag : match ( x[2] )
2819   end
2820 end

```

Now, the LPEG for the numbers. Of course, it uses digit previously computed.

```

2821 local Number =
2822   K ( 'Number' ,
2823     ( digit ^ 1 * "." * # ( 1 - P "." ) * digit ^ 0
2824       + digit ^ 0 * "." * digit ^ 1
2825       + digit ^ 1 )
2826     * ( S "eE" * S "+-" ^ -1 * digit ^ 1 ) ^ -1
2827     + digit ^ 1
2828   )
2829 local alphanum = letter + digit
2830 local identifier = letter * alphanum ^ 0
2831 local Identifier = K ( 'Identifier' , identifier )

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the keywords.

The following LPEG does *not* catch the optional argument between square brackets in first position.

```

2832 local split_clist =
2833   P { "E" ,
2834     E = ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1
2835         * ( P "{" ) ^ 1
2836         * Ct ( V "F" * ( "," * V "F" ) ^ 0 )
2837         * ( P "}" ) ^ 1 * space ^ 0 ,
2838     F = space ^ 0 * C ( letter * alphanum ^ 0 + other ^ 1 ) * space ^ 0
2839   }

```

The following function will be used if the keywords are not case-sensitive.

```

2840 local function keyword_to_lpeg ( name )
2841   return
2842     Q ( Cmt (
2843       C ( identifier ) ,
2844       function(s,i,a) return string.upper(a) == string.upper(name) end
2845     )
2846   )
2847 end
2848 local Keyword = P ( false )

```

Now, we actually treat all the keywords and also the key `moreredirectives`.

```

2849 for _ , x in ipairs ( def_table )
2850 do if x[1] == "morekeywords"
2851     or x[1] == "otherkeywords"
2852     or x[1] == "moreredirectives"
2853     or x[1] == "moretexcs"
2854 then
2855   local keywords = P ( false )
2856   local style = [[ \PitonStyle{Keyword} ]]
2857   if x[1] == "moreredirectives" then style = [[ \PitonStyle{directive} ]] end
2858   style = tex_option_arg : match ( x[2] ) or style
2859   local n = tonumber ( style )
2860   if n then
2861     if n > 1 then style = [[ \PitonStyle{Keyword} ]] .. style .. "]" end

```

```

2862     end
2863     for _ , word in ipairs ( split_clist : match ( x[2] ) ) do
2864         if x[1] == "moretexcs" then
2865             keywords = Q ( [[ \ ] ] .. word ) + keywords
2866         else
2867             if sensitive
2868                 then keywords = Q ( word ) + keywords
2869                 else keywords = keyword_to_lpeg ( word ) + keywords
2870             end
2871         end
2872     end
2873     Keyword = Keyword +
2874         Lc ( "{" .. style .. "{" ) * keywords * Lc "}"
2875 end
2876 if x[1] == "keywordsprefix" then
2877     local prefix = ( ( C ( 1 - P " " ) ^ 1 ) * P " " ^ 0 ) : match ( x[2] )
2878     Keyword = Keyword + K ( 'Keyword' , P ( prefix ) * alphanum ^ 0 )
2879 end
2880 end

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the strings.

```

2881 local long_string = P ( false )
2882 local LongString = P ( false )
2883 local central_pattern = P ( false )
2884 for _ , x in ipairs ( def_table ) do
2885     if x[1] == "morestring" then
2886         arg1 , arg2 , arg3 , arg4 = args_for_morekeywords : match ( x[2] )
2887         arg2 = arg2 or [ [ \PitonStyle{String.Long} ] ]
2888         if arg1 == "s" then
2889             long_string =
2890                 Q ( arg3 )
2891                 * ( Q ( ( 1 - P ( arg4 ) - S "$\r" ) ^ 1 ) -- $
2892                     + EOL
2893                 ) ^ 0
2894                 * Q ( arg4 )
2895         else
2896             central_pattern = 1 - S ( " \r" .. arg3 )
2897             if arg1 : match "b" then
2898                 central_pattern = P ( [ [ \ ] ] .. arg3 ) + central_pattern
2899             end

```

In fact, the specifier `d` is point-less: when it is not in force, it's still possible to double the delimiter with a correct behaviour of `piton` since, in that case, `piton` will compose *two* contiguous strings...

```

2900         if arg1 : match "d" or arg1 == "m" then
2901             central_pattern = P ( arg3 .. arg3 ) + central_pattern
2902         end
2903         if arg1 == "m"
2904         then prefix = P ( false )
2905         else prefix = lpeg.B ( 1 - letter - "]" - "]" )
2906         end

```

First, we create `long_string` because we need that LPEG in the nested comments.

```

2907     long_string = long_string +
2908         prefix
2909         * Q ( arg3 )
2910         * ( VisualSpace + Q ( central_pattern ^ 1 ) + EOL ) ^ 0
2911         * Q ( arg3 )
2912     end
2913     LongString = LongString +
2914         Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "{" ) * Cc "}" )

```

```

2915     * long_string
2916     * Ct ( Cc "Close" )
2917   end
2918 end
2919
2920 local braces = Compute_braces ( String )
2921 if piton.beamer then Beamer = Compute_Beamer ( lang , braces ) end
2922
2923 DetectedCommands = Compute_DetectedCommands ( lang , braces )
2924
2925 LPEG_cleaner[lang] = Compute_LPEG_cleaner ( lang , braces )

```

Now, we deal with the comments and the delims.

```

2926 local CommentDelim = P ( false )
2927
2928 for _ , x in ipairs ( def_table ) do
2929   if x[1] == "morecomment" then
2930     local arg1 , arg2 , other_args = args_for_morecomment : match ( x[2] )
2931     arg2 = arg2 or [ [ \PitonStyle{Comment} ] ]

```

If the letter i is present in the first argument (eg: morecomment = [si]{\*}{\*}), then the corresponding comments are discarded.

```

2932     if arg1 : match "i" then arg2 = [ [ \PitonStyle{Discard} ] ] end
2933     if arg1 : match "l" then
2934       local arg3 = ( tex_braced_arg + C ( P ( 1 ) ^ 0 * -1 ) )
2935         : match ( other_args )
2936       if arg3 == [ [ \# ] ] then arg3 = "#" end -- mandatory
2937       CommentDelim = CommentDelim +

## 10 History

The successive versions of the file `piton.sty` provided by TeXLive are available on the SVN server of TeXLive:

<https://tug.org/svn/texlive/trunk/Master/texmf-dist/tex/lualatex/piton/piton.sty>

The development of the extension `piton` is done on the following GitHub repository:

<https://github.com/fpantigny/piton>

### Changes between versions 2.6 and 2.7

New keys `split-on-empty-lines` and `split-separation`

### Changes between versions 2.5 and 2.6

API: `piton.last_code` and `\g_piton_last_code_tl` are provided.

### Changes between versions 2.4 and 2.5

New key `path-write`

### Changes between versions 2.3 and 2.4

The key identifiers of the command `\PitonOptions` is now deprecated and replaced by the new command `\SetPitonIdentifier`.

A new special language called “minimal” has been added.

New key `detected-commands`.

### Changes between versions 2.2 and 2.3

New key `detected-commands`

The variable `\l_piton_language_str` is now public.

New key `write`.

### Changes between versions 2.1 and 2.2

New key `path` for `\PitonOptions`.

New language `SQL`.

It’s now possible to define styles locally to a given language (with the optional argument of `\SetPitonStyle`).

## Changes between versions 2.0 and 2.1

The key `line-numbers` has now subkeys `line-numbers/skip-empty-lines`, `line-numbers/label-empty-lines`, etc.

The key `all-line-numbers` is deprecated: use `line-numbers/skip-empty-lines=false`.

New system to import, with `\PitonInputFile`, only a part (of the file) delimited by textual markers.

New keys `begin-escape`, `end-escape`, `begin-escape-math` and `end-escape-math`.

The key `escape-inside` is deprecated: use `begin-escape` and `end-escape`.

## Changes between versions 1.6 and 2.0

The extension `piton` now supports the computer languages OCaml and C (and, of course, Python).

## Changes between versions 1.5 and 1.6

New key `width` (for the total width of the listing).

New style `UserFunction` to format the names of the Python functions previously defined by the user.

Command `\PitonClearUserFunctions` to clear the list of such functions names.

## Changes between versions 1.4 and 1.5

New key `numbers-sep`.

## Changes between versions 1.3 and 1.4

New key `identifiers` in `\PitonOptions`.

New command `\PitonStyle`.

`background-color` now accepts as value a *list* of colors.

## Changes between versions 1.2 and 1.3

When the class `Beamer` is used, the environment `{Piton}` and the command `\PitonInputFile` are “overlay-aware” (that is to say, they accept a specification of overlays between angular brackets).

New key `prompt-background-color`

It’s now possible to use the command `\label` to reference a line of code in an environment `{Piton}`.

A new command `\_` is available in the argument of the command `\piton{...}` to insert a space (otherwise, several spaces are replaced by a single space).

## Changes between versions 1.1 and 1.2

New keys `break-lines-in-piton` and `break-lines-in-Piton`.

New key `show-spaces-in-string` and modification of the key `show-spaces`.

When the class `beamer` is used, the environments `{uncoverenv}`, `{onlyenv}`, `{visibleenv}` and `{invisibleenv}`

## Changes between versions 1.0 and 1.1

The extension `piton` detects the class `beamer` and activates the commands `\action`, `\alert`, `\invisible`, `\only`, `\uncover` and `\visible` in the environments `{Piton}` when the class `beamer` is used.
